BMCC library adds new function

The library at Blue Mountain Community College has been designed as an official depository for U.S. Government publications, according to Mary Bates, BMCC head librarian.

Mark Hatfield, U.S. Senator from Oregon, made the designation of the library as a selective depository. Only the library at Portland State University is a full governmental document depository in the state of Oregon.

As a selective depository, certain documents will automatically come to the college. Others, the college may select to receive.

This designation is "quite a coup" for Umatilla county, according to Bates. The documents will be housed not only at the BMCC library, but also at the Umatilla County library, the Umatilla County Law Library and East Central Oregon Association of Counties (ECOAC).

Documents of "significance to the region" such as those relating to agriculture, industry and governmental interests will be selected to be received, Bates added. The college has always had a hard copy of the Congressional Record available, she noted, but now it will be on microfiche.

Among those items now to be sent by the federal government are: Budget of the U.S. Government, Catalog of Federal Domestic Assistance, Census Bureau Catalog, Code of Federal Regulations, Congressional District Data Book and the like.

Librarians from the various agencies that will store the documents will hold an orientation session and workshop Nov. 3 at Blue Mountain Community College to learn how to organize the collection. Dick Meyers, in charge of documents of the state of Oregon library in Salem, will conduct the workshop.

Bates, who was responsible for the original planning for requesting the designation, noted that the BMCC library's newest function is "in line with the regional mission the college has." She noted also that as a designated depository, the library receives the documents for free, instead of having to subscribe to them as has been done in the past.

In addition to being a federal depository, the BMCC library also has state of Oregon governmental documents available as well as census material. The library is the regional energy library and is a fire science library as well.

Delivery of U.S. governmental documents is expected to begin in the spring.

QUICK QUIZ

The Wonders Of America's National Parks

How much do you know about natural wonders in this country? Taking this test can put some of your wondering to rest.

1. In which state is there a park where you can have a snowball fight—even in the middle of the summer? (a) Wisconsin (b) Colorado (c) Montana

2. Which state features a park with beautiful cascading waterfalls and towering sequoia trees? (a) New York (b) California (c) Wyoming

3. Which state is the home of a national monument that offers the chance to walk on craters resembling those on the moon? (a) Texas (b) Idaho (c) Florida

4. Where is a national monument that allows you to climb sand dunes even though you are not near the ocean? (a) Utah (b) Colorado (c) Ohio

Answers: 1. (c) Glacier National Park, West Glacier, Montana. 2. (b) Yosemite National Park, California 3. (b) Craters of the Moon National Monument, Idaho. 4. (b) Great Sand Dunes National Monument, Grand Lake, Colorado.

In the

Garden Patch

by Susan Russell

When the weather turns cold I usually find it hard to get outside and do any yard work. I'm betting that I'm not the only timid one when it comes to nasty weather, so this month I thought I would write about something that can be done indoors. How about starting some new plants with cuttings from plants you have in your home?

There are many ways of going about propagating new plants from your old house plants. The most familiar way is to take short cuttings and place them in a glass of water until roots develop. This method has usually worked well for me. However, most gardening manuals state that roots developed in water are brittle and more difficult to transplant than roots produced in a moist soil mix. If you would like to try rooting cuttings in a potting mix, this is a good method. Put a small clay pot inside another, larger pot so that there is about an inch between the pots. Fill this inch of space with damp soil and place cuttings in the soil. Fill the small inner pot with water. The water will seep out of the pot and keep the soil around the cuttings evenly moist.-

Some common house plants can be rooted from leaf cuttings. Streptocarpus or "Cape Primrose" and Begonia are two of these. Take a leaf and make several cuts along the mid-rib. Tack the leaves down firmly in a pot so that the cut ribs are in contact with moist soil. Tiny new plants will grow from each cut in the leaf.

African Violets and Sansevieria can be rooted by placing a leaf upright in a pot of soil. For African Violets, cut a leaf with one-quarter to two inches of stalk remaining. Place the stalk in the soil and support the leaf with toothpicks. A new plant will sprout from the stalk. For Sansevieria, cut a piece of the leaf about three inches long and bury an end about an inch or so in potting soil. Again, the new plant will emerge from the base of the old leaf.

With any of these leaf cutting methods, it would be a good idea to use a loose plastic bag to make a mini green house over the rooting pots. This will prevent the leaves from drying out before roots can form. Be sure that the plastic doesn't touch the plants or they may rot. Make sure that there is some air circulation into the plastic cover either by leaving the bottom open or by poking small holes in the top of the plastic bag. Check the soil in the rooting pots often to make sure that it doesn't dry out.

Layering is another way to root new plants. With this method, it is possible to start larger stems than with the other methods. To layer a plant the stem at the point where roots are desired is notched or girdled and wrapped with a moist rooting medium. This can be either sphagnum moss or potting soil. Hold a small amount of the rooting medium around the notched stem of the plant to be layered. Cover the medium with plastic and loop string around it to tie it securely to the plant stem. Keep the soil or moss damp and roots will develop at the wound in the plant stem. When you can see that a good root system has developed, cut the plant below the layer and re-pot. This method would be especially good on a plant such as a Dieffenbachia that has a long cane but has lost most of its lower leaves.

I hope this has given you some ideas so that you can put your green thumb to work inside during these cold winter months. If you have quick rooting plants, you may even be able to get some starts potted up in time for Christmas gift giving.
