Why Do We Replace Brake Calipers?

We do more than replace brake pads. Factory re-manufactured calipers include new seals and hardware in addition to pads. This allows for better caliper operation, complete piston return and less brake drag.

Why Replace the Drum Brake Hardware?

Heat affects the spring tension over time. We replace the drum brake hardware for proper brake shoe hold down and return. This allows the brake shoes to wear evenly and for reduced brake drag.

Why Do We Machine Brake Rotors and Drums?

Machining the rotors and drums provides a proper finish for sealing the new brake friction and preventing brake vibration and pulsation.

Why Bleed and Flush the Hydraulic Brake System with a Brake Repair?

The natural trait of brake fluid is to attract moisture. This occurs even in a sealed system, which will reduce the boiling point of the fluid and increase the chance for corrosion. We bleed the system to remove air and flush to refresh the brake fluid. This helps reduce the chance of brake fade and prolongs the life of hydraulic components.

ALIGNMENTS For Better Handling & Tire Mileage

Every car should at least have a thrust alignment. It relates all 4 wheels to a common center line to insure maximum tire life and a centered steering wheel.

Over 90% of all cars built today should have a 4 wheel alignment. Most front wheel drives and some rear wheel drives have rear wheel adjustments. We invite you to ask us about it.
