

GRESHAM OUTLOOK

Published every Tuesday and Friday at Gresham, Oregon, by the Outlook Publishing Co., H. L. St. Clair, Editor and Manager.

One year, \$1.50, six months, 85c, three months, 50c. Single copies, 10c. Combination rates with all the Portland Dailies.

Entered as second-class matter March 3, 1913, at the Postoffice at Gresham, Oregon, under the Act of March 3, 1879.

MRS. DELLA BROWNING DIES AT COTTRELL

Mrs. Della Browning passed away very suddenly last Saturday morning, January 17, at the home of her daughter, Mrs. Dora Mathews, of Cottrell, at the age of 53 years, 11 months and 27 days. The direct cause of her death is attributed to organic heart disease, induced by diabetes, from which she had been a sufferer for a considerable length of time.

She had been taken to Salem for treatment, but was brought back to her daughter's home the night before her death.

Della Barnes was a native of Springfield, Illinois, and came with her parents to Oregon at the age of 11 years, spending most of her life in and around Gresham. She was married to Alexander C. Browning, in Gresham, on June 3, 1892. Five children were born to this union, one of them dying in infancy. The other four were with her at the time of her sudden passing. She was conscious to the end and shortly before her death expressed herself as being happy because her children were all permitted to be with her.

Besides her four children, Mrs. Dora Mathews and Clarence Browning, of Cottrell, Mrs. Elsie Andrews, of Cascade Locks, and Everett Browning, of Hoquiam, Washington, she is survived by an aged mother, Mrs. Laura J. Barnes, of Milwaukie; a brother, Sylvester Barnes, of Portland; two sisters, Mrs. Ellen Douglass of Pittsburg, California, and Mrs. Etta Widner, of Delhi, California; five grandchildren and a host of sympathizing friends.

The funeral was held at the undenominational temple on Tuesday afternoon at 1 o'clock, conducted by the Rev. S. F. Pitts. A ladies' quartet, composed of Mrs. Hattie Wilkinson, Mrs. Jess Hite, Miss Floella Jacobs and Mrs. Melvin Sunday, with Mrs. Charles Moore at the piano, sang "Face to Face" and "Beautiful Isle of Somewhere." Miss Jacobs sang as a solo, "Lead Kindly Light." Interment was in Douglass cemetery.

The spokesman for the Mikado announces that Japan's relations with all treaty powers, including this country, were never more friendly. We are all glad of that. We have for Japan only the most sincere feelings of kindness and admiration.

At the same time it is interesting, and not amusing, to consider these facts: Japan builds 500 airplanes each month, keeping seventeen factories busy night and day. According to our Brigadier General William Mitchell, a sound authority on air service, this Government owns, in all, only 700 airplanes, big and little. And of the 700 only twenty would have any value as fighting machines. Therefore, Japan builds each month twenty-five times as many serviceable planes as we have altogether.

And we have in America only 450 pilots that could be used for air battles, in time of war. Japan, England, France have thousands.

The rich that fight taxes and all for economy fear one thing even more than loss of their dollars, and that is talk of revolution. Just one thing could bring bloody revolution and uprising in this country. And that would be shameful defeat in war, with horrible loss of life and property, due to lack of preparation. The very rich men and corporations that control this nation, dictate its candidates and its laws, should bear that in mind and not push economy too far.

JAZZ BABY DOT. (By MARY SAIKI) Over a heart of conceit and sin A shadow passed of shame one day. Said shame to that rebellious heart, "Why do you trifle your life away?" Yet all unmindful of this warning call She played its game with the human heart. Regardless still of the awful pall And heeding not shame's warning smart. Down into every type of vice, Yes, 'e'en down to the pits of hell, She mingled with the sordid crowd. What did she learn? O who can tell? Yes, who would dare to tell the tale That laid a trusting mother dead. And found a stubborn, frightened child All crumpled on a prison bed? Now sorrow melts the hardened heart, Now droops the head of heedless sin. Past falls the smothering, burning tears— Too late, too late; shame entered in.

Words, Concord, Niagaras, one year old. Splendidly rooted, sure growers. Low prices. Order now for fall planting. Harold Oberg, Craig road, fourth house north off Barr road, Tabor 6014, Portland, R. 7, Bx. 966.

Signs of the Times. "Why these muddy streets?" asked the tourist stopping at Spindlerburg. "Have you no town pride?" "That ain't mud, stranger," replied the country store clerk. "That's Ford axle grease."

CONFERENCE GROUPS MAKE REPORTS

Continued from page 1

It is recommended that producers secure all chicks at one time where only one brooder and one common range are available.

4. At Least 15 Acres Needed for Every 1500 Hens.

Many poultry enterprises, successful for a time, have been compelled to quit business because of soil contamination. This is caused by using the same area over and over for brooding and ranging the stock. One and two acres devoted to poultry keeping on a large scale is hazardous, where young stock is reared annually. Real estate agencies should not exploit such small tracts for intensified poultry raising.

It is recommended that commercial poultry keeping should not be attempted on less than 15 acres of tillable land, for a unit of 1500 hens, where chicks are to be reared each year. A system of field alterations must be worked out on this minimum area to make poultry keeping a success over a period of years. Additional range territory may be needed at times for growing stock, such as orchards, groves or fields in order to provide disease free soil.

The overhead investment necessary in operating a poultry enterprise is large. There is no use in jeopardizing the investment by trying to economize on land. A lack of sufficient acreage has been the chief factor in the downfall of poultry farms.

5. Movable Brooder House Is Best.

Poultry producers of the county will succeed according to their foresight and ability to raise pullets to maturity that are vigorous and free of intestinal inflammation and parasites. This can be done more safely through careful effort to brood chicks and range them on clean soil each year.

The movable brooder house is recommended as the safest system of brooding chicks. Producers may guide their construction plans by Experiment Station circular 52. For this system of brooding the coal burning brooders were given first endorsement by those expressing opinions. Small sized hard coal or gas briquettes were highly recommended as the desirable fuel. The use of oil brooder stoves with inside reservoirs were generally discouraged on account of fire hazard and insufficient temperature during cold weather. Opinions varied relative to the use of electric brooders as many felt that they were still in the stages of experimentation.

On farms where a permanent brooder house is desired or because of hill land it must be used. It is recommended that it be located in the center of a given area in such a way that two or more yards may be provided. Under this system it is understood that only one yard is to be used each year in its logical turn.

The opinion relative to types of brooders for the larger permanent brooder houses varied between the use of coal oil brooders with outside tanks, the coal stove, and electrical types.

The actual cash outlay for brooding and bringing the pullets into production is slightly above one dollar at present feed prices. This does not include labor, interest on investment, taxes and depreciation of equipment. The approximate cost of feeding the pullet from six months of age for one year at present prices is \$3.00.

The necessity of protecting the investment and future of the business demands careful study and arrangement of brooding equipment.

6. Use Range House Recommended By College.

In any system of brooding the brooder house and brooder yard are to be used only until the pullets are old enough to do without artificial heat and it is therefore recommended that producers use a range house like or similar to the one recommended by Oregon Agricultural College in Station Circular 54.

Proper poultry houses are necessary for the permanent home of the pullets when they are ready to move in off the range. Too many laying houses are constructed according to some untried hobby rather than to use as a pattern some types of house that has proven satisfactory. It is recommended that producers desiring to build laying houses be guided by the building plans set forth in Station Circular No. 51.

7. Proven Type of Laying House Should Be Used.

Proper poultry houses are necessary for the permanent home of the pullets when they are ready to move in off the range. Too many laying houses are constructed according to some untried hobby rather than to use as a pattern some types of house that has proven satisfactory. It is recommended that producers desiring to build laying houses be guided by the building plans set forth in Station Circular No. 51.

8. Green Feed Throughout the Year.

Green feed is one of the four major classes of poultry feeds necessary to growth of egg production. The four classes are as follows: mineral, animal, grain (ground, cracked and whole) and green feed. Green feed is the most important item in the ration of growing chicks. It increases the efficiency of all other feeds fed, supplies vitamins; adds bulk to the ration in the cheapest form and should be fed in abundance.

Kale does not always live through the winter in the county, hence, root crops, alfalfa hay, cabbage, etc., should be provided each year as an emergency feed.

The hen must produce fifteen dozen, or 180 eggs, per year in order to return the owner a dollar for his labor. Green feed safeguards the health and vigor of the flock and as such is a vital factor in getting the desired egg yield.

It is recommended that poultry keeping be discouraged on farms where green feed in some form cannot be economically supplied throughout the year.

9. Expansion of Industry Here Is Justified.

Climatic conditions and availability of green feed are factors quite favorable to poultry production in the county. The marketing of surplus quality eggs is now done efficiently through the state cooperative marketing agency. Rail and highway conditions are favorable for transportation of produce to market and of feed and supplies back to the farm.

Soils not used for poultry would be enriched by the fertilization value of poultry manure. The smaller farms of the county frequently have surplus labor to invest, which may be used economically with a balanced poultry enterprise.

Inasmuch as a market exists for good eggs, it is therefore recommended that poultry keeping be increased in the county, provided such increase be guided by the principles of management outlined in the foregoing articles of this report.

10. Considerable Capital Necessary.

Poultry propaganda is misleading and too little has been said relative to the capital necessary. It has been exploited as an easy business, one that requires but little capital and little experience needed.

The poultry group assembled desires to present the following facts for the benefit of those desiring to engage in the business. Costs will vary with different individuals according to plans, ideals and ideas.

Where the farm and home are owned, it will require an outlay of cash of approximately \$2.90 to raise the average pullet to an age where she starts to produce eggs. This cost is pro-rated as follows:

Brooder house, brooder and brooding.....\$.40

Feed plus mortality losses to six months of age..... 1.00

Permanent laying house, material and labor..... 1.50

Where the land is to be purchased, dwelling, fences and new buildings erected, chicks, equipment, feed, etc., purchased, the overhead per bird will vary from \$8.00 to \$10.00.

11. Disease Investigation Needed.

One of the serious, limiting factors of poultry production in the county or
