EUGENE—Demonstration trials to compare Austrian winter field peas with vetch as an orchard cover crop are being carried on in Lane county again this year. Orchardists cooperating in these trials with O. S. Fletcher, county agent, are Roy Woodruff, E. C. Cleverdon, Frank B. Harlow, James Gardens, Chase Gardens, all Eugene, and McKenzie Blossom farm, Springfield. Former trials of this nature have been non-conclusive, Fletcher says. Where the peas were planted without a companion crop they made an excellent growth, apparently better than vetch, but where sown with a grain crop they smothered out worse than the vetch.

SPECIAL NOTICE: Thursday, January 21, at 8:00 o'clock, a great mass meeting will be held at the Methodist church, in the interest of World Peace, and Disarmament.

THE CHRISTIAN WORKERS' COUNCIL of Umatilla County

Note—The following article is prepared by the publicity committee of the Christian Workers' Council of Umatilla county. — Editor.

No Nation is Independent Today.

Once the thirteen colonies of this country, felt that each colony was sufficient unto itself. But when they had a common enemy, England, the thirteen colonies finally became the United States. Today, Massachusetts has her state powers and she realizes that the federal government has its powers. And by uniting with other states, Massachusetts is better protected from an outside enemy than she could possibly be if relying on her own unaided powers. Massachusetts gains therefrom by federating with the United States. No single colony of the thirteen was independent.

Since the early colonial days, the world has grown smaller. It takes two minutes for New York to hear from Berlin. We can fly over the Atlantic in thirty-six hours. So that as far as a communication is concerned, nations are as near each other as the thirteen colonies used to be in our country. Now the different nations have hitherto thought that each was sufficient unto herself. But when they have a common enemy, war threats, the nations of the world should finally become the united world. That is, they should work together in some such plan as World Disarmament.

Today, America has her own powers. And by uniting with other nations in the coming World Disarmament, America will be better protected from the menace of war, than she could possibly be if she relied on her own unaided powers. America will gain therefrom in co-operating with World Disarmament on the part of other nations. No

single nation of the fifty, is independent.

Once we celebrated July 4th as Independence Day. Let us now celebrate February 2nd, at Geneva as Inter-dependence Day.

WITH FARMERS AROUND THE STATE

PRINEVILLE—Constant work of Crook county dairymen eliminating contagious abortion is showing good results, reports County Agent W. B. Tucker. In tests of 51 cows in five herds last month not a single reactor nor suspect was discovered.

GRANTS PASS—The turkey population of Josephine county has increased about 100 per cent during the past year, reports County Agent H. B. Howell. There are at least six flocks of more than 1000 birds each in the county, and it is estimated that more than 40,000 turkeys were produced for market this year.

BAKER—Sulfur, applied at the rate of 100 pounds to the acre, increases the yield of alfalfa on Baker county farms from 50 to 100 per cent. This has been proved in trials carried on during the past four years, according to P. T. Fortner, county agent. Sulphur has now been applied to more than 800 acres of alfalfa in the county, increasing the yield at least a ton or more of hay per acre at a sulfur cost of \$2.50 per acre. On the basis of \$7 hay, this brings an increased return to alfalfa producers of \$5600 annually for a four-year period.

BAKER—Baker county farmers are manifesting considerable interest in Crested Wheat grass for pasture, but difficulty is being experienced in locating seed supply, reports County Agent P. T. Fortner. Among those who have indicated an intention to plant this grass this year are T. H. Tibbs and Lee A. Duncan of Haines; Hardy Murray, Unity; W. R. Hawley and L. C. Hansen of McEwen, and Andrew Salvay of Bridgeport. This grass will also be included in a new dry grass trial in which T. C. Deeringer of Hereford will cooperate with Mr. Fortner.

HENS NEED WATER TO PRODUCE EGGS

Also Well to Heat It in Cold Weather.

Forty cents a quart is a high price for water, but that is what it is estimated to be worth when converted into eggs worth 30 cents a dozen. A dozen eggs contain about a pint of water. No wonder hens like to drink.

But that is only one of the demands for water by hens. It is calculated that 100 laying hens will transpire at least three gallons of water per day as vapor, a fact that makes an adequate watering system vitally essential in the poultry house. Damp litter and damp walls—cold weather in large measure due to this giving off of moisture by the hens. Suppose only a third of that three gallons of water fails to get away by means of the ventilating system. In a week there will be five gallons of water absorbed by the litter, floors and walls, with inevitable reduction in production and probably the beginning of disease.

In winter weather the use of water heaters has been proved a profitable practice. Energy used up by the hen in warming her water is energy subtracted from the egg basket. An electric current or some other simple heating device can warm water much more cheaply than can the hen.—Exchange

No Large Returns for Small Poultry Raiser

Rural economists at the New York State College of Agriculture blast the hopes of many who look forward to a little farm, a cow, a flock of chickens, and a comfortable living. According to figures of 124 poultry farms it takes money to run a profitable poultry farm.

Flocks averaging 500 layers had a capital investment of \$10,000, a gross income of \$3,000 and an average labor income, or profit after interest and all expenses were deducted, of \$300.

With 900 layers the capital increased to \$15,000, the gross receipts to \$6,200 and the labor income to \$819. Farms with 1,000 birds have \$26,000 invested, gross receipts of \$13,850 and \$2,344 for labor income.

Farms with 2,000 hens had gross receipts about four times that of the 500 hen flocks but the labor income was seven times higher. This shows the importance of a business large enough so that the operator can make good returns for his time, which means a plant with 2,000 birds or more.—Michigan Farmer.

Best Food Containers

"Use feed and drink containers that will keep the chicks out of them," is the advice of F. E. Moore, extension poultryman of the North Dakota Agricultural college. He suggests that a feed trough be made for the chicks from four pieces of lath—one for the bottom, two for the sides and one over the top, nailed to the end pieces extended just high enough to allow the chicks to reach their heads through to feed but not high enough to allow them to get entirely into the trough. For use later when the chicks are larger, 3 or 4-inch boards instead of lath are suggested. Tin or galvanized containers are satisfactory for milk provided sour milk is left standing in them from 36 to 48 hours before they are used for the first time.

Tipping Pullets' Beaks

A new method of tipping the beaks of pullets as they go into the laying house for winter may prevent feather pulling, toe pecking and cannibalism, according to D. C. Kennard of Ohio agricultural experiment station at Wooster.

Kennard makes a little cut in the upper beak one-eighth of an inch or so from the end, just enough to get a start and tears the tip of the beak off, near the quick. The beak will grow out again, but by that time the pullets will have become adjusted to their confinement and will possibly pass up the vices that sometimes come into the flock when they are put into the winter quarters. Kennard states.

Soybean Hay for Poultry

Poultry raisers in districts where soy beans are grown are reminded by the University of Illinois that the hay made from this crop provides a good green feed for chickens. It may be fed freshly cut in summer or as cured hay in the winter. To be most valuable as a winter feed it should be well cured without excessive bleaching. Cakes or baskets suspended in the poultry house are the best means of feeding the hay to poultry.—F. C. Illinois, in Successful Farming.

To Cool Eggs

Adaptation of the egg in hatched less cooler in the cooling of eggs is reported as having been tried successfully by Prof. J. E. Hensley of the poultry husbandry department, University of California. To insure the hatching covering of the egg, it is kept damp water is fed to it by water tubes from a reservoir on top. The supply of water is regulated by a float valve. Copper sulphate is introduced into the water to stay the destructive effect of mold on the hatching.
