Poultry Gleanings

Lancashire, England, has more hens than people.

Found for pound, a pullet needs four times more oxygen than a cow.

Pale yolks are produced on such feeds as white corn, wheat, oats, and barley.

One hundred pullets should eat about 25 pounds of feed daily. The proportion of grain to mash will vary.

In the case of a fresh egg, the shell is dull and often has a sort of "bloom" on it; shells of stale eggs are glossy and smooth.

When a bird is dry-picked, it will lose about one-tenth of its weight when the blood and feathers are removed. In other words, a 15-pound turkey will lose about one and a half pounds in dressing.

Systematic and continuous culling of poultry brings results quicker than almost any other piece of work on the farm.

Hens that are fed a small amount of cod-liver oil, about 2 per cent of their ration, produce eggs containing more copper and iron.

An inexpensive piece of galvanized sheet iron has been found to be a satisfactory covering for henhouse dropping boards. It is vermin-proof and easily cleaned.
