#### MEDFORD MAIL TRIBUNE, MEDFORD, OREGON, MONDAY, FEBRUARY 20, 1911

### Lime-Sulphur---Its Use as a Fungicide and an Insecticide

-By-Prof. P. J. O'Gara, Pathologist. Written especially for the Medford Mail Tribune. (Copyright, 1911, by Medford Printing Company.)

(CaS5) as possible. It may be stat-

ed then, that the 1-2-1 fromula

should be followed. Our formula will

1 pound lime.

2 pounds sulphur. .

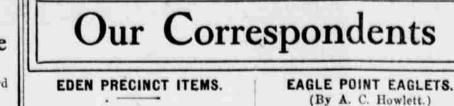

gallon water.

(Sixth installment.) Making the Lime-Sulphur Spray. So far we have treated mainly of

then read; the chemistry of lime-sulphur and it will now be necessary to explain how the wash is prepared commercially, as well as the making of it, by the grower himself.

As was stated in the first chapters the amount of lime and sulphur used varied with the different formulae and the proportion of each used had no bearing on the chemistry of the spray and, therefore, it was not very infrequent that too much lime, as well as too much sulphur, was used. The firse commercial lime-sulphur compounds were used as a sheep dip, just as the older preparations had been used many years before limesullipar was used as an orchard spray. Everyone is familiar with the Rex, Niagara, Ortho, Sampson and various other commercial lime-sulphurs.

It is not our intention to go into the matter of these so-called patent sprays, but merely to state that the commercial brands differ from the home-made wash or spray principally in that they are in a highly concenarated state. This high concentration has made it feasible to prepare the lime-sulphur wash as a commercial commodity to be stored. slipped and sold for insecticidal and fungicidal purposes. The home-made washes usually have a low conceu tration while the leading commercial brands are approximately nine or ten times as strong as the homemade mixtures. The best of the commercial preparations differ markedly in appearance from the wash made by the fruit grower himself i that there is no heavy sediment or settling. This has been excluded by decanting off or filtering the clear liquid. Another important property of well made commercial brands is that they are comparatively free from crystallization when subjected to sudden changes of temperature. This result has been attained by using the minimum amount of lime necessary to unite with the sulphur, and after the wash has been prepared. by keeping it in air-tight containers However, variations in the degree of concentration of commercial limesulphurs may occur with different patches of the same brand. It often impossible, even under the best of conditions, to prepare a lime-sulphur of definite strength. In the early history of the concentrated lime-sulphur manufacture it was very difficult to make different boilingof uniform density and analyses of the same brand showed great variation, sometimes all the way from 25 to 34 degrees Beaume. At the present time, however, all of the better brands show a very high degree of concentration and are generally quituniform in density. The Home-Boiled Wash. To the fruit grower who makes his own lime-sulphur solution, it is im portant, not only to know that lime and sulphur are used, but the relative amounts as well as the length of time necessary to boil the mixture; and, finally, the determination of the strength or specific gravity and the amount of dilution necessary to use it, so that it will have the de- the kettle and start the fire; place sired effect.
