Fuses and Safety

A fuse in an electric circuit is a safety device designed to open the circuit at a certain load.

Its use is to prevent the wires in the circuit protected from carrying more than their rated capacity and to prevent fires and damage to electrical apparatus.

Fuses are placed at various points in the electrical circuits where the wires branch or change size; also at the entrance to the building to protect the wiring in the building, and on the pole outside of the building to protect the transformer and outside circuit.

When a fuse blows, there is usually a cause for it, such as an overload or damaged circuit and the cause should be found and repaired before replacing the fuse.

Better investigate and eliminate any risk that may exist. Your Contractor Dealer can protect you at a nominal cost.
