

AUGUST MARKED BY LONG SPELL OF HOT WEATHER

Monthly meteorological notes for August as compared by W. J. Hutchison, local meteorologist, show a month of warm summer weather with mostly clear skies and with temperatures averaging abnormally high after the first week. Precipitation was restricted to a few very light showers, insufficient to be of material benefit to agriculture. A few days were characterized as partly cloudy and one as totally cloudy. During the opening week temperatures were moderate and mild weather was enjoyed. Beginning the 8th temperatures lifted to higher levels and continued above normal throughout the balance of the month. A period of unusually hot weather began on the 22nd with maximum temperatures above 100 degrees occurring daily and including the 26th. Thunderstorm conditions developing in the mountains during the afternoon and evening hours of the 26th effected a moderation of temperatures in the valley, although they remained well above normal to the close of the month.

Traces of rainfall were recorded on the 2nd, 25th and 28th, and 0.02 of an inch, the only measurable precipitation falling, was recorded on the 27th. Under normal conditions the August rainfall should be 0.24 of an inch, indicating a deficiency of 0.22 of an inch. The rainfall season ending August 31 shows a total seasonal amount of 11.04 inches and as compared with the normal is deficient 0.4 inches. Since the beginning of weather bureau records for Medford in 1911 there has been but one rainfall season showing a greater deficiency. The period September 1, 1923, to August 31, 1924, shows a seasonal total of 10.58 inches, or a shortage of 7.50 inches.

In the evening of the 27th following a day of sultry depressing weather with thunderstorms developing over surrounding mountain areas heavy southeasterly winds swept the valley for about an hour beginning approximately at 8:30 p. m. A maximum velocity for a five-minute period registered 42 miles per hour during one of the heavier blows. Gusts estimated to have attained a velocity of 80 miles per hour were observed at times. Reports indicated that damage in some pear orchards was quite severe, and lighter losses were also sustained in apple orchards.
