**Blood Pressure**  
"What is normal blood pressure?" This is a question so frequently asked. It is difficult to answer for each individual in general terms. The height of the person has its influence on blood pressure. That which is now considered normal blood pressure is less than formerly held. It is now considered a fallacy that the blood pressure should rise a point a year. That denotes disease. For the normal adult of average size, in a state of rest, the blood pressure should be between 100 and 120. For a vigorous man in a state of health, many consider it ideal between 110 and 120, but that 125 is allowable. Should the pressure creep up, gaining beyond 130, an incipient disease is indicated. However, it may not cause great trouble for five, ten, or fifteen years later. When the blood pressure starts to creeping up beyond normal, it is time to take a health inventory.

## BRITISH LIBERATE MACEDONIAN CITY

Rome, Oct. 30.—(U.P.)—British troops liberated the Greek Macedonian capital of Kozane yesterday after a stiff fight and are pushing the Germans back toward the Yugoslav frontier, 35 miles to the north, a communication said today.

The Germans put up a fierce battle on the western outskirts of the city but were routed by mid-afternoon, suffering considerable casualties, and fled northward. British patrols were reported in full chase early today, harrying Nazi rearguards back along the main highway into Yugoslavia.

Kozane is 190 miles north-northwest of Athens and about 60 miles west of Salonika, the last important Greek city still in German hands.
