Study of Pacific Ocean To Effect American Lives

San Diego, Calif. —(U.P.)—A 4,000,000-square-mile area of the equatorial Pacific is being studied by west coast marine scientists, whose findings will affect many segments of American life.

The area, which fans outward from the Panama Canal, is almost a total blank now on the navigation and research charts. Included are waters of the eastern equatorial Pacific off Central America and northern South America.

The studies will embrace projects ranging from the underwater speed of sound to observations on the size of the tuna population in the area. The findings will be of interest, at least casually, to the housewife who makes a tuna salad as well as to shipwrecked mariners or airmen whose use of small sound bombs at time of disaster may save their lives.

The exploration involves the ships and scientists of the Naval Electronics Laboratory at San Diego; the Scripps Institution of Oceanography; the U.S. Fish and Wildlife Service and the Inter-American Tropical Tuna Commission. The last named is a group now supported by Costa Rica and the university and is concerned with the life, habits and psychology of the far-ranging and elusive tuna.

The Electronics Laboratory ship, the EPCE (R) 857, has left San Diego on the first leg of her journey, which will be concentrated along the shipping lanes of the eastern equatorial Pacific.

Before returning here late this summer, she will cover 10,000 or more miles and will stop at many Mexican ports.

The Scripps' vessel, the Horizon, is scheduled to depart San Diego about May 15, and will concentrate on a study of the equatorial ocean currents. The Inter-American Tropical Tuna Commission biologists will go on the voyage, gathering data about the tuna population for later relay to the skippers of the large clippers that base at San Diego and San Pedro.

The U.S. Fish and Wildlife Service's Pacific oceanic fisheries investigations plans to conduct simultaneous cruises in the ocean area of the west of that being studied by Scripps and the NEL.

Possibly of most interest to the average American family, which normally schedules tuna in one form or another as a meal during each year, is the program of investigation into the life and habits of this elusive marauder, about which comparatively little is known.

Earlier research has established that great schools of tuna live, spawn and hunt in a 700-mile wide band extending northward from the Equator, and to at least within 1,500 miles of the Central American coast. In this band there are many ocean currents, which, where they meet, boil upward, bringing food of various types for the tuna.

Commercial fishermen are anxious to know whether this band of tuna extends eastward to Central America. That information is of great potential commercial value, for it could mean that clippers could leave port, load with bait rapidly and then go directly to fishing grounds where tuna abound, load and return to port without loss of time.

Might Reduce Prices

Such a program would mean lowered per unit costs of catching fish, which, in turn, could shave the ultimate cost of the tin of tuna that the housewife buys from the corner grocer.

In the Electronics Laboratory experiments on the speed of sound, small depth bombs will be dropped at specific locations to test and evaluate a search and rescue network established by the Navy. This system spans the Pacific between stations at Kaneohe, Oahu, Hawaii, and Pinta and Arena in California.

Long-distance transmission of sound between refracting "layers" of water is a basic principle in the system, which scientists hope some day may be used in sea disasters to pinpoint locations of survivors. So far, the longest sound transmission by use of this system has been 3,500 miles.

RICKETS OFTEN UNRECOGNIZED

From the age of three or four weeks every baby should receive every day not less than 300 or 400 units of vitamin D to prevent rickets. A scant teaspoonful of cod liver or other fish liver oil contains 300 or 400 units of vitamin D. A single drop of one or another concentrate of fish liver oil, such as conDol, viosterol, contains 300 units of vitamin D.

Some babies get such a daily ration of vitamin D for several months or for the entire year. But too often doctors and parents forget about it before the baby has outgrown the need for it. Not until about the eighteenth month, when some babies begin to get sufficient vitamin D from egg yolk and butter (the only foods that can supply enough for a growing child), may the fish liver oil, conDol or viosterol be discontinued—that is, if you wish to give the baby a fair break.

Some good doctors advise not one teaspoonful of fish liver oil but three daily; not a single drop of fish liver oil concentrate, conDol or viosterol, but three drops daily—that is, 900 or 1000 units of vitamin D daily.

It is hardly possible to learn in one easy lesson how to diagnose rickets, but the mention of some common manifestations of this calcium deficiency disease (vitamin D merely promotes assimilation and utilization of calcium) will give a fair idea of the disease. Incidentally, milk and egg yolk are the best food sources of calcium for infant or growing child.

Familiar symptoms or signs of rickets escape recognition in many instances because parents and sometimes doctors are prone to dismiss them as "teething," "indigestion" or nervousness.

Rickets is not just a bone disease. The bone changes are secondary. It is a nutritional deficiency disease and affects the whole body. The baby with rickets is tired, restless, unhappy, fretful by day, by night sleeping badly, turning, twisting, throwing off bed covers. He impatiently rolls his sweating head on his pillow, perhaps wearing away his hair. His bowels are constipated except for sudden attacks of diarrhea. His abdomen is distended because muscle coat of alimentary tract is flabby, lacks tone, as are the muscle and ligaments of the whole body, so that the limbs may be twisted into bizarre positions.

It is especially unfortunate for

the baby with early rickets that susceptibility to the cri (common respiratory infections) is characteristic of the disease. This encourages (blankety) parents and (blank) doctors and (censored) saireygamps and (shall we say just) quaint people to deny the baby his place in the sun or the chance to play most of the time dressed only in dikes. Sunlight or just diffuse daylight (in the shade), if permitted to reach the skin, facilitates the vitamin D the baby needs.

Suffice it merely to mention here the more frequent bone changes of rickets: Late closure of fontanelles (soft spot on top of head remains soft—it should feel as hard as the rest of the skull by the 18th month). Beading of the ribs. Large square-shaped head, prominent forehead, Pigeon breast. Harrison's groove—a constriction around upper chest at armpit level with outflaring ribs below to conform with the pot-belly. Spinal curvature. Enlarged wrists. Knock-knees or bow-legs. Retarded growth of long bones. Flatfoot.

Altho the daily vitamin D supplement may be discontinued

MOO-O-O-S and MUSINGS

We walked over to the Crater Theater yesterday to see the 187 pound watermelon on display in the lobby.

We got there just in time to see two small boys puffing and grunting as they rolled the giant melon through an exit on their way to a king sized stomach ache.

Little Daisy

In some instances when the baby is eighteen months old, especially if the baby has the boon of sufficient everyday exposure to ultraviolet in sunshine and shade, I am sure an extra ration of vitamin D can do no harm and I recommend as a kind of health insurance such a daily ration along with calcium, phosphorus, iodine, thiamine and riboflavin, right on thru childhood, youth and maturity, as described in the pamphlet **Young Folks and Old Folks**, available on written request if you provide stamped, self-addressed envelope.

Editor's Note: Dr. Brady is now on a two-weeks vacation. Questions and answers usually printed here will be resumed upon his return.

Ancient Musket Found In Oregon Stream

Albany, Ore. —(U.P.)—Larry Knight was fishing for bass in the Calapooya river when he lost his pole. Dragging for his lost gear, Knight pulled up an ancient flintlock musket which still had traces of black powder in the chamber, indicating the pioneer who lost it had the weapon loaded when it fell into the stream.

Fort Worth, Tex. —(U.P.)—It was a case of being two places at the same time, Judge William H. Gilmartin reasoned. He dismissed an overtime parking ticket given to a man who was in court waiting for his case on another charge to come up.

NO RELATION, THOUGH

Richmond, Va. —(U.P.)—Bureau of Internal Revenue in Richmond decided that George Washington and Martha Washington are entitled to income tax refunds. The 20th century George lives in Richmond; Martha lives in Near Beach, Va.

CROSSWORD PUZZLE

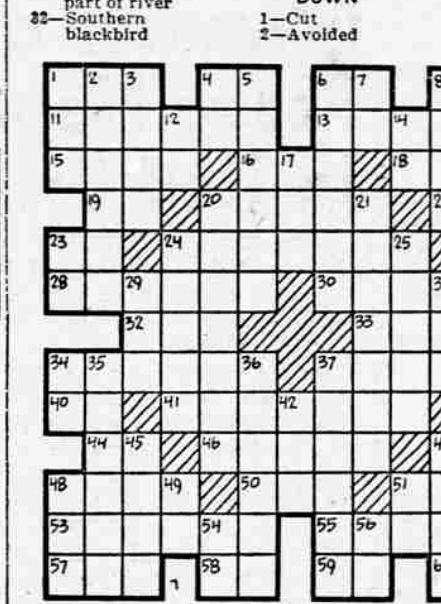

Answer to Saturday's Puzzle

ACROSS

1—Border on dress
4—Maiden loved by Zeus
6—Note of scale
8—Baby's napkin
11—Occurrence
12—Completed
13—Walk in water
15—Vessel
16—Solitary
19—Prefix: down
20—Talk idly
22—Babylonian deity
23—Pronoun
24—Seesaw
25—Exists
26—Unusual event
27—Swiftly flowing part of river
32—Southern blackbird

DOWN

1—Cut
2—Avoided
3—Mournful
5—Stones carved in relief
7—Lawmaking body
9—Concerning
10—Killer
14—Chopping tool
16—Grain (abbr.)
17—Smooth
18—Jumbled type
21—Greek letter
28—Plumlike fruit
29—Greek letter
31—Girl's name
33—Listener
35—Cowboy competitions
37—Sen eagle
38—Bone
39—Old pronoun
40—Noah's boat
