Knowledge of Obscure Sickness Raises Public Health Questions

By DELOS SMITH
United Press Science Editor

New York — New scientific knowledge of an obscure sickness called "silo-filler's disease" has raised two important questions of public health.

The questions were raised by Dr. R. R. Grayson, an authority on the disease since he works in Perryville, Mo., where silo-filling is a major occupation.

Dr. Grayson's questions are: Isn't the cause of silo-filler's disease also the cause of some of the sickening qualities of some of the smogs that hang over industrial cities? And can't that cause be contained on occasion in the cereal grains which people eat?

The cause of silo-filler's disease is the combining of nitrogen with oxygen which occurs in the fermentation stew that goes on inside silos. The disease is a peculiar type of pneumonia which can be fatal. Silo fillers get it by working inside poorly ventilated silos.

Thorough Study
Dr. Grayson was the first to describe the disease, back in 1954. There now have been 11 fully authenticated cases — in silo-fillers. But with accumu-

lated knowledge of the disease process and how the process is put into motion, Grayson now is convinced that it "is not confined to people who fill silos, but has afflicted others in many occupations and places and no doubt is a factor in other obscure respiratory illnesses."

Sputnik I Had Three Sections; Not Two

By UNITED PRESS

Scientists at the Smithsonian Astrophysical Laboratory in Cambridge, Mass., said today that Sputnik I, the original earth satellite, has three sections, not two as first believed.

The experts said various reports from moon watchers throughout the world showed the nose cone of the rocket is the third section. Previously, only the satellite and the rocket were definitely identified.

It was also believed that Sputnik II may have a second part, besides the section which carried Laika, the space dog. Five or six observations by expert astronomers indicate the satellite has two separate parts.

In a report issued by the Soviet Union Wednesday, scientists said Sputnik I will expire by the end of December while Sputnik II will enjoy an "appreciably longer" life.

Moscow Radio said Laika apparently was "comfortable to the end" and was alive at least until last Sunday when radio transmissions from the satellite stopped.

He pointed to such illness in the residents of industrial cities. He cited analytical studies showing that 463 tons of nitrogen oxides go into the Los Angeles atmosphere daily, and the prevailing notion that five parts of nitrogen dioxide per million parts of atmosphere will do no harm. From the new knowledge of silo-filler's disease, five parts could be harmful.

The Culprits
Nitrates are contained in growing plants, such as corn. That is normal. But Grayson said that under normal conditions such as constant plant struggling against drought, nitrates accumulate even to poisoning levels.

He pointed to various obscure diseases which have appeared in cattle and other grazing animals and said they were basically due to nitrate poisoning. Since it happens to these animals, "it is possible that people may also at times get into the same trouble after eating grain." He urged physicians to look for these nitrate caused disorders "among our patients."
