Study Stresses Importance of Balanced Diet

Washington, D.C.—Children in their early years do best on varied diet and should not receive so much milk that they fail to eat enough of other foods. The importance of milk is never discounted by medical investigators, but also should not be over-emphasized, according to studies summed up by the editors of Nutrition Reviews Magazine.

One study by Price and Hart reported in Journal of American Medical Association dealt with malnutrition and anemia in 50 children aged 1 to 4 years. This showed that the children had a high intake of milk associated with a low intake of cereals, fruits, vegetables, meat and eggs. Examples of a day's diet of three of the children revealed a startling absence of iron-containing foods and fruits and vegetables naturally rich in required vitamins.

It was pointed out by Price and Hart that education of the parents in these cases was as important as proper medical treatment of the child. The parents were well aware of the importance of milk but were not aware of the need for bulk and varied diet once the child is beyond infancy.

a little girl's World

All blue skies, all serene days . . . and always within easy reach . . . everything to make her happy. Little girls expect it to be so. And, if Daddy had his way, it would be like this, always. But even the most ideal childhood—planned so carefully by the best of parents—cannot last forever.

The most we can hope to do is help the youngsters grow up strong . . . willing to assume responsibility . . . able to carry burdens with grace and dignity . . . finding meaning in their own particular lives.

But while they are still children there is this that we can do. We can show them how much we depend on weekly worship, by taking them with us, to our church or synagogue.
