London—UPI—A soapbox orator at Hyde park who bragged that he "knew everything" was asked "how many periods in a bottle of ink?" by a less-than-enthralled listener. The orator was perplexed.

New Type Propeller Will Give Aircraft Longer Cruise Range

Windsor Locks, Conn. — (UPI) — A radically-designed propeller is being developed for the Navy which engineers expect will give aircraft a longer cruising range and allow shorter takeoffs with considerably heavier payloads.
Now undergoing wind tunnel tests at Hamilton Standard division of United Aircraft Corp., its inventor, George Rosen claims that by changing the surface curvature of the blade, known as the blade camber, it will be possible to adjust the lift of a propeller blade to the most efficient level for any flight condition. Rosen is chief of analysis at Hamilton Standard.
A full-scale prototype is scheduled to be ready within nine months and production will start within two years.
Could Increase Range
William E. Diefenderfer, Hamilton engineering manager, said the new variable camber propeller could increase the range of high-speed transports by 30 per cent, and add 50 knots to the speed of low-level attack planes.
"For long-range, endurance aircraft — that is, early warning and anti-submarine types — takeoffs with heavy fuel loads would be possible even from short runways," he said, "with endurance improved as much as 20 per cent. In the case of future verticle take off aircraft, the propeller might mean payloads half again as big as those envisaged now."
Rosen explained his variable camber propeller this way: "Next to size, the camber of a propeller blade is the most important single factor in determining its lift. By changing the blade camber, it would be possible to adjust the lift of a propeller blade to the most efficient level for any flight condition. Thus it would avoid the compromise of efficiency between the requirement for takeoff versus cruise operations embodied in the design of all propeller blades today."
Single Air Foil Surface
He said the new propeller would use "six or eight blades staggered behind the front ones. Each pair of front and rear blades would create a single air foil surface similar to an airplane's wing with its flaps extended. To change the camber, the propeller would automatically alter the angles at which the front and rear blades meet the air. Since the two blades are in effect one surface, this change of angle would vary the overall camber of the blades, just as a wing's curvature changes when the flaps go down. The result would be to increase or decrease lift."

Tallahassee, Fla. — (UPI) — Sheriff John Ray Broxson told a state appeals board Monday he has to borrow money from the bank to keep the sheriff's office operating in Santa Rosa county because County Judge M. C. McCall is imposing "exceedingly low" fines on offenders.
