

RECEIVE ORDERS—Three barefoot Meo tribesmen, a group of people living in the mountains near Vang Vieng, Laos, receive orders from the Royal Laotian Army. The tribesmen have been effective in the bitter guerrilla warfare against Communist troops in Laos. (UPI Telephoto)

Psychological Tests Detect Brain Damage

Washington (Science Service) — Undetected brain damage, which may cause behavior, language and learning problems in children of normal intelligence, may show up in psychological tests.

Dr. Raymond L. Clemmens,

Methotrexate Cures Many Cancer Cases

Atlantic City, N. J. (Science Service) — Of 63 patients with a highly malignant form of tumor, 30 are now free of evidence of the disease as the result of chemical treatment.

Three scientists from the National Cancer Institute reported results of the treatment with Methotrexate of chorioepithelioma which develops in the womb of pregnant women.

Dr. Roy Hertz, John L. Davis Jr. and Mortimer B. Abramson reported that all cases consisted of invasive growths of this follicle acid antagonist. In 14 women treatment also included brief courses of a recently developed plant derivative called Vincristine sulfate.

The scientists said the uniquely favorable response of this rare form of cancer may be due to the fact that it originates from the cells and therefore may be more easily expelled from the mother's body.

FAST GROWTH

Manila — Most rapid grower of the higher plants is believed to be the bamboo.

director of the Central Evaluation Clinic for Handicapped Children, University of Maryland School of Medicine, Baltimore, told the American Academy of Pediatrics here that the usual neurological examination, even when expertly performed, may not reveal causes of disorder.

Minimal brain damage, causing the brain to function less than normally, can cause deviations in behavior and learning, as well as minor hearing and seeing problems, Dr. Clemmens said.

These peculiarities may not be noticed until the late preschool or early school years, the pediatrician reported.

"Psychological testing may yield positive evidence of organic cerebral dysfunction although the classical neurological examination is negative," he said.

Dr. Felix P. Heald, director, adolescent medicine, Children's hospital here, told the meeting that a study of body fat in adolescent patients should become a routine part of examinations.

"Changes in total body fat during adolescence are not well understood," Dr. Heald said. The fact that there are normal and important differences in body fat between adolescent boys and girls has received little emphasis.
