

Farm & Garden

White Top Control Plans Suggested by Weed Man

By RAY HUBBELL
County Weed Control
White top (hoary cress) is nearing full bloom in the Rogue river valley. Although considered in our secondary group of noxious weeds, we are attempting control of this weedy pest. All known infestations have been or will be visited and control measures adapted to the situation will be taken. This will vary due to the location and crop in which white top is found.

Selective sprays are applied to grain crops tolerant to the

sprays used, with a nonselective spray applied following harvest if growing conditions warrant this procedure. Spot treatment may be used in crops susceptible to sprays if the infestation warrants this. Infestations on road shoulders, ditch banks and fence lines or where no crops are involved, eradication measures are taken.

Due to the persistency of many infestations, control measures are all that can be applied without jeopardizing crops being grown. Owners of orchards infested with white top are being asked to assist by discing, mowing or destroying the seed crop of this year's growth. White top can be spread both by seed and roots, so cleaning of equipment moved from an infested area to one clean of this weed is warranted. This holds true to any cultivated ground, orchards or otherwise.

Any infestations of white top that have not been visited or owners contacted, I would appreciate your calling SP 3-8215, leaving the name and phone number of the party calling and the location of the white top infestation. White top, along with some 19 other noxious weeds, are controlled by the county weed control district at county expense. The property owners or lessor are required to sign a property release before control measures can be taken.

Range Meeting Scheduled Here

A special committee of the Jackson County Stockmen's association will meet with Rogue National Forest officials at 2:30 p.m., Thursday, April 17 in Room 210 in the U.S. post office building in Medford to discuss range allotments and policies for the new fiscal year, according to Association President Leroy Offenbacher.

Due to limited space it has been requested that only the range advisory committee and a special committee appointed earlier by Offenbacher attend the meeting. Specifically the cattlemen will discuss resolutions presented the Forest Service officials during the annual spring meeting and which were read to the natural resources interim committee during its hearing in Medford yesterday.

Members of the present range advisory committee are Lance and LeRoy Offenbacher, Dean Owens, Henry Owens, J. W. Bigham, Charles Stanley, Irvin Ross, Oscar Hanson, Albert Straus, and D. Estremado.

Members of a special range committee are Martin Grier, Gordon Stanley, Ernest Stolin, Dave Woolfolk, Wallace Ragsdale, John Black, and Jim Miller.

Egg Group Forms, Officers Elected

Elmer Korner, Sams Valley egg producer, was elected president of the newly formed Southern Oregon Egg Producers' council when it met in Grants Pass April 25.

Other officers are Jim Dodson, Medford, vice president; Mrs. Robert Cocks, Eagle Point, secretary-treasurer; and Bob Irwin, Provoit and Wilis Stiehl, Rogue River, named to the board of directors.

This week a special committee is preparing the by-laws for the new organization. It will meet again on May 8, at 7:30 p.m. at North's Chuck Wagon restaurant.

Garden Tips

By JOHN McLOUGHLIN
County Agent

Rhododendrons
Remove the spent blooms of rhododendrons as soon as they fade. This will prevent seed formation, which is a drain on the vigor of the plant, and will hasten the start of new shoots. It is important that these shoots make an early start, if maximum growth is to be obtained and flower buds are to set for next spring's bloom.

Cut the faded flowers with pruning shears or a knife. Be careful not to injure the new shoots and leaf buds that are below the flowers. Also remove the spent blooms of azaleas, mountain laurel and andromeda.

Pine
The principal reason for pruning plants of the pine family is for size control. Prune pines when the tips of the needles can be seen on the candles. Pinch these candles back in proportion to the amount of new growth you wish to develop.

By selective pinching you can train the plant into any desired shape. Removal of all the candles will prevent the development of new growth.

Disbudding Roses
Disbud all but the terminal bud on each stem for a large exhibition type rose. This will result in a much larger flower. Disbud when the flower buds are still small. Partial disbudding of polyanthas will improve their flower clusters.

Cutting Roses
Use only sharp shears when cutting roses. During the first season of bloom, cut the flowers with short stems. Many gardeners cut flowers with stems so long that they rob the plant of too much foliage. This reduces the subsequent growth capacity and flower yield of the plant.

On established plants, leave at least two leaves between the cut and main stem. Remove the withered individual flowers in a cluster to give the remaining flowers more room to develop.

Roses that are cut just before the petals start to unfold will continue to develop normally and remain in good condition longer than if they are cut after they are fully open on the plant.

Aphids
Apply insecticides now to plants that have aphids on them. Good control will be harder to obtain later on when the leaves fold due to aphid feeding. Malathion, lindane or diazinon will control aphids. Follow the recommendation on the label.

TOUR SCHEDULED—The spring tour of the Cal-Ore Hereford association is scheduled for 9:30 a.m., Sunday, May 20 and will cover the Hereford ranches in the southern half of the Rogue valley. Visits scheduled are to the Arrowhead ranch, Chloe Small's El Cresto ranch, and a lunch stop at Nichols 5-C ranch on Emigrant lake. Afternoon visits will include the Irelands' Polled Hereford ranch, Mel Tinker's ranch and last stop at the Howell Cook ranch. Dick Ireland, association president said Eddie Meeker is in charge of the tour and E. N. Lippert master of ceremonies. The above picture was taken at the E. N. Lippert ranch at Williams, Ore. when the tour party lined up for the barbecue.

Spraying Urged For Beetle Pest

Home gardeners who have had trouble in past years with elm beetles should spray soon. These pests first become noticeable to the home gardener when the leaves start turning brown and the tree takes on a sickly appearance. Trouble starts when the black and yellow striped beetles emerge from the ground in the spring and start feeding on the leaves. Soon clusters of bright yellow eggs appear on the undersides of the leaves and hatch into greenish yellow worms which eat the green portion off the leaf leaving only a clear filament.

Later in the summer the homeowner will notice the beetles crawling down the tree trunk and gathering in clusters at the base of the tree. Since there are several broods a year, damage starts early and continues until fall frost.

Control for elm leaf beetles consists of spraying the tree with two pounds DDT and two pounds of Malathion per 100 gallons of water. Ordinarily one spray containing these materials applied during the first part of May will prevent serious beetle damage to elms for the remainder of the season. Occasionally where infestations are severe a second spray is needed. This should be applied only if a buildup of beetles is noted.

Seeding Check Requests Needed
Alfalfa seed growers with 1962 alfalfa seedlings are asked to file seeding inspection requests this month with the county extension office, according to Gene Winters, county agent.

One of the requirements of the Oregon alfalfa seed certification standards is that alfalfa to be taken for seed must have been inspected and passed in the seeding stage.

Talent and Lahontan alfalfa varieties are harvested for seed in Jackson county under the seed certification program. Talent alfalfa seed classes eligible for planting are Breeder, Foundation or Registered. Only Breeder or Foundation classes of Lahontan are eligible.

Alfalfa seedling inspections are made in June by Oregon State university extension seed certification specialists. A blossom time inspection for stands producing seed will be made in late July or early August. Applications for this inspection are due July 1.

Growers needing additional information about the seed certification program should contact the county extension office.

Bid Accepted For Wool Pool

A top bid of \$55.38 per hundredweight for fleeces was accepted from the R. C. Elliott company, Salt Lake City, when the Jackson County Wool Pool association directors met on May 1 at the county extension office, according to Don Bohnert, president.

Low bid of the five was submitted at \$49.55. Delivery date was set for July 1 over 3,000 fleeces signed up. Anyone interested in the pool may telephone SP 3-2815, Bohnert said. A prospective fat lamb shipment is scheduled to leave around June 1.

Prices accepted for the wool include 38 cents a pound for lamb's wool, 15 cents for tags and 38 cents a pound for black fleeces.

Liquid lime sulfur, eight gallons to 100 gallons of water, or 12 pounds Polysulphide per hundred, is the recommended practice in commercial orchards. Home gardeners should use one quart liquid lime sulfur in three gallons of water or one pound dry lime sulfur in three gallons of water. Two applications of dusting sulfur as a substitute for the lime sulfur spray is sometimes used. The first dust is applied as the first blossoms open, with a second application about ten days later. Thorough coverage is necessary with either spray or dust.

Homeowners are cautioned not to use lime sulfur on Boysenberries or Loganberries as the spray is generally not necessary on them, and if used during hot weather may cause burning and leaf drop.

Southern Fryers Now Competing With Local Birds

The Rogue Valley Broiler Growers association held its regular meeting April 29. Mr. and Mrs. Warren Merrill were guests. Merrill is the new Oregon Broiler commission manager.

The broiler growers have many problems facing them. Feed prices are not in comparable price to the selling price of fryers. Merrill discussed imports, and the problem they are to the local producer.

Our fryers are shipped from the farm at night to the killing plant; processed in the early morning and can reach the market the same day. That is what we call an Oregon fresh grown fryer. Sometimes the imports were shipped fresh — though processed out of state, put into refrigerated trucks and started out across the country. By the time they reach Oregon they are from four to seven days old.

Shipped From South
The southern states are freezing their fryers, and shipping them into Oregon. They have started a new process called "flash freeze."

These fryers have never seen the inside of a freezer, they are soaked in a brine solution. This process stops bacteria on the outside of the chicken, but the bacteria action continues on the inside of the chicken from the bone out.

Fortunately more and more housewives are demanding the top quality of an OREGON FRESH FRYER. An import cannot insure this freshness.

In 1961 over a million fryers were produced in Medford and Grants Pass. This year due to high priced feed and low selling price of fryers, many growers have bowed out of the fryer business. We believe all Oregon products should be proudly displayed and sold. Let's keep our payroll in Oregon. So the next time you buy a fryer, look for and demand an Oregon grown fryer.

New Standards For Berry Plants

Salem — Changes in Oregon standards for strawberry plants which will result in greater uniformity with those of neighboring states are now in effect. The changes were proposed at a public hearing held in Salem on Feb. 21 by the state department of agriculture.

Principal changes in the regulations deal with length of roots, condition of plants and packing and marking of containers.

Length of main roots for Oregon No. 1 plants may be not less than 2 1/2 inches; at least 12 main roots are required. Previously, 14 main roots were required.

Oregon No. 2 plants are required to meet all the requirements of Oregon No. 1's except for a minimum main root length of 2 1/2 inches, and 8 or more main roots.

Oregon No. 1 strawberry plants must be packed in new clean crates, with not more than 1000 plants in a single package. However, 2,000 plants will be permitted to a crate of Oregon No. 2's, as required by growers at the hearing. The number of plants must be indicated on the container.

Another change in the standard is a modification of the "clean" requirement to a more realistic "fairly clean."

Consumers usually spend about 20 cents of their food dollar for dairy foods.

Keep a bag of coarse salt handy this winter for de-icing steps and paths.

CORRY'S REALLY WORKS!

Original ENGLISH FORMULA

CORRY'S SLUG & SNAIL DEATH

BEST OF THE BAITS

FROM THE GROUND UP

By BART BARTLETT

A passing observation of the pastures throughout the valley indicates that relatively large acreages of range land would benefit from a moderate application of nitrogen fertilizer. It is too late now for an application of nitrogen on dry land range, but irrigated ranges would still benefit from such treatment.

Some hay fields would also be helped by an application of nitrogen at this time. It should be applied just prior to an application of irrigation water and only when the grass is dry.

The soils of this area are not of very great depth and every effort should be made to maintain such depth as exists on each area of agricultural soil. Yet one frequent soil farmer, orchardist, and rancher who cultivate over or into road ditches, creeks or irrigation canals. This operation alone moves soil out of the fields and little by little the soil depth is decreased. Perhaps a greater loss of soil is by the erosive action of irrigation water that is allowed to flow in too great amounts and wash large quantities of top soil into canals and road ditches. If agricultural soil is to be a long term venture in the area, greater effort must be made to conserve the small amount of soil that is here now.

The orchard heating season was not too severe. It is felt by many that the pending elections were a benefit in this regard. The office seekers generate considerable atmospheric temperature and turbulence, which may have lessened the need for supplemental heat this year. Government is large and ever growing larger. By his own claims each office seeker can improve on the performance of the incumbent in that there will be tax relief, economy in government, etc. The claims are too varied and numerous to mention here. It has long been noted, however, that each elected official is like the one he replaced because pre-election claims are soon forgotten.

Generally speaking Republicans are happy with a Republican in office and the same is true for Democrats. Their thinking is more psychological in politics than a reality of fact in office.

Seed stocks of some recently recommended sweet corn varieties seem to be non-existent in the area.

Any fruit trees that show a declined or unthrifty condition at this time should be marked for removal. Trees that are sick after the favorable spring we have had, are not likely to recover.

It should be sufficiently safe now as far as frost is concerned to finish planting

vegetable and flower gardens with even the most tender of plants.

Tradition is the one great hindrance to progress.

261 Head Sold At Phoenix Yard At Saturday Sale

Phoenix — The market was steady with the week before with a total of 261 head of cattle sold during the regular Saturday, May 5 sale at Rogue Valley Livestock Auction, Inc., reported Bob Bever, manager.

Whiteface calves were selling at \$10 to \$20 per head higher with only 11 head offered. Two good whiteface calves sold at \$70 per head. Holstein calves sold at \$28 to \$39 per head. Guernsey and Jersey calves sold at \$8 to \$17 per head.

All classes of light cattle sold well by the head. One pen of 270 pound whiteface heifers sold at \$82.50 per head. Holstein steers in the 300 to 350 pound class sold at \$75 to \$90 per head.

There was a small offering of good quality cattle in light weight, but the cattle offered sold at high prices. Whiteface steer calves in the 400 to 500 pound class sold at \$27.30 to \$29.50. Whiteface heifer calves in the same weight class sold at \$24.30 to \$25.20.

Yearlings sold at steady prices with 600 to 800 pound animals going out at \$22.90 to \$24.10. Whiteface yearling heifers sold at \$22.10 to \$23.20.

Holstein steers were high again with light steers in the 350 to 500 pound class selling at \$23.60 to \$25. One pen lot of 630 pound Holstein steers sold at \$23.60.

Slaughter cows again sold at strong prices. One load of grain-fed young whiteface and Holstein cows sold at \$19.60 to \$20.60.

Whiteface utility cows sold at \$18.80 to \$18.30. Holstein utility cows sold at \$15.70 to \$16.60. Canner and cutter cows sold at \$14.10 to \$15.60. A few shelly yellow cows sold down to \$11.00.

"A good run of cattle has been consigned for the sale on Saturday, May 12. If you have cattle to sell at this time, consider selling this week. Look for weaker prices on cattle as summer weather gets hot," Bever advised. "Sell your cull cows now before the California runs start."

Auction Yard Owner To Attend USDA Meet
Bill Bray, owner-manager of the Midway Auction yard on Table Rock rd. will fly to Boise, Idaho, Wednesday to attend a meeting of the U.S. Department of Agriculture officials with the National Auction Markets association of officials.

There Bray and others will discuss the problems arising from the packers and stockyards act as it affects the marketing industry.
