

Eminent Scientists to Determine Relationship of Smoke, Lung Cancer

Editor's note: Three years ago the U.S. Public Health Service advised Americans that the surest way to avoid lung cancer was to quit smoking. This added new fuel to an already-raging tobacco vs. cancer controversy. The Surgeon General has now decided to appoint a panel of eminent scientists to determine whether the original statement should be reaffirmed, modified, or completely withdrawn. Vital health and economic issues hinge on the outcome.

By DAVID D. LEWIS
United Press International
Washington - (UPI) - The chief government guardian of national health is about to jump into one of the medical profession's long unsettled debates—the controversy over whether tobacco smoke kills, cripples or just pacifies humans.

Surgeon General Luther L. Terry of the U.S. Public Health Service is expected to name soon an expert panel to make a full investigation of all previous data concerning the relationship of smoking to health problems, including whether it causes lung cancer. He has said the group also will look at other possible health hazards such as automobile exhaust, industrial smog and other air pollutants.

When the new findings are analyzed, this panel, or a new one, will make recommendations. Then it will be up to Dr. Terry to decide what action, if any, is warranted.

Will Head Study
The Surgeon General himself will head the study which is being financed by the Federal government. The other 11 panel members will represent the whole spectrum of the scientific fields involved.

Billed as "unbiased," the panel will be selected from among more than 150 eminent scientists. By mid-October, 10 of the 11 had been chosen, although it had been expected the group would be at work on the initial six-month phase a month earlier.

One PHS official helping to coordinate the selections told UPI that "these people had to be like Caesar's wife — pure beyond doubt in their lack of bias or any prejudiced notions of the relation of smoking to health. At least, if they had such notions, they must have kept them quiet."

Before invitations to serve on the panel were issued, interested parties were allowed to "veto" any candidate for "any reason whatever," the official said.

Opinions on Qualifications
Opinions of candidate qualifications were solicited from the Tobacco Institute, Inc.; American Cancer Society; American Heart Association; American Medical Association; American College of Chest Surgeons; the National Tuberculosis Association; the Food and Drug Administration; the Federal Trade Commission; and President Kennedy's Office of Science and Technology.

First phase of the study will investigate "the nature and magnitude of the health hazard." It will be a purely scientific review of available data and probably will include public hearings. From this will be distilled a philosophy on the smoking-health problem attested to be the collective professional reputation of the experts.

The second phase — perhaps carried out by a different group and likely to include representatives of the President's committee, the FDA and FTC — will seek to chart a course for the government, the public, the tobacco

industry, and the medical profession.

The problem is fraught with political, economic and social implications, as well as its obvious implications to the nation's health. Such statistics as these indicate the breadth of the issue:

—There are an estimated 70 million to 100 million tobacco users in the United States. Some experts assert that 75 per cent of all American men and 50 per cent of the women are regular smokers at some time in their lives.

The tobacco industry has an estimated annual income of more than \$7.5 billion and is a heavy advertiser in the various media of communications.

—Federal and state income from tobacco taxes runs about \$3 billion a year.

—The economy of six states which are top tobacco producers is materially affected by the industry. These are Georgia, Kentucky, North Carolina, South Carolina, Tennessee and Virginia. Fifteen other states are involved as lesser producers.

Depend on Tobacco
—17 million Americans depend on tobacco for all or part of their livelihood, including 800,000 farm families in the 21 producing states.

Tobacco is the nation's fourth largest agricultural crop.

The debate over the relative danger or benefit of tobacco to mankind has been ranging for more than 400 years, from the time smoking was introduced to western civilization by Spanish explorers of America in the early 1500's.

In a report on smoking in relation to cancer and other diseases published last March, the British Royal College of Physicians said tobacco almost from the beginning became both very popular and very controversial.

Last month, the U.S. Agriculture department reported cigarette sales rose 2 per cent in 1962 to an all-time high after a steady rise of 3 or 4 per cent from 1955-1961. The department estimated 1962 production at 539 billion cigarettes, up 11 billion, and 7.3 billion cigars, up about 140 million.

Other tobacco production in the United States fell off, however, it said. Pipe tobacco production dropped 3 million pounds to 71 million pounds; chewing tobacco fell to a new low of 64.5 million pounds, down about 1 per cent; and snuff production hit a 47-year low of about 32.8 million pounds, down 3 per cent.

Agriculture officials hedged on whether tobacco production would increase again next year. They said a rise seemed likely in 1963 but that the revival of the debate over the impact of smoking on health might affect the market.

Long as the controversy has been under way it has not been until fairly recent years that the U. S. government has stepped in as a debater.

Five years ago, then Surgeon General Leroy E. Burney said "the Public Health Service feels the weight of the evidence is increasingly pointing in one direction: that excessive smoking is one of the causative factors in lung cancer."

Two years later, in a special report on the smoking-health situation in November, 1959, Burney issued a series of statements which the PHS believed "justified by studies to date." These 1959 statements were:

—The weight of evidence at present implicates smoking as the principal etiological factor in the increased incidence of lung cancer.

—Cigarette smoking particu-

larly is associated with an increased chance of developing lung cancer.

—Stopping cigarette smoking even after long exposure is beneficial.

—No method of treating tobacco or filtering the smoke has been demonstrated to be effective in materially reducing or eliminating the hazard of lung cancer.

—The non-smoker has a lower incidence of lung cancer than the smoker in all controlled studies, whether analyzed in terms of rural areas, urban regions, industrial occupations, or sex.

Stand By Statements
Dr. James Hundley, assistant surgeon general for plans, said recently that the PHS stood by the 1959 statements and would do so until new findings are developed.

Last April, however, a PHS official said, Surgeon General

Terry gave former Health, Education and Welfare Secretary Abraham A. Ribicoff a re-evaluation of the Burney report. The official said this re-evaluation—never made public—was based on new evidence, including the British Royal College report, the decision of Denmark and Italy to ban cigarette advertisements, and other reports by scientists.

Sen. Maurice Neuberger, D-Ore.; Sen. Frank E. Moss, D-Utah, and a number of co-sponsors have introduced a bill which would create a presidential commission to do

generally the same job as the Surgeon General's panel is intended to accomplish.

Numerous studies in recent years have added or detracted from the weight of evidence supporting a smoking-cancer link or a relationship to other disorders, including heart disease and respiratory ailments.

Recent Pronouncement
Among the most recent pronouncements pro and con were these:

—Dr. Warren H. Cole, former president of the American Cancer Society, said on Sept. 23 at Chicago that 24

studies made since 1950 found "there is a very sharp relationship between cigarette smoking and cancer of the lungs." He predicted most lung cancer would be eliminated "within 20 years" if people stopped smoking cigarettes.

—The Tobacco Institute replied from New York with a statement that "repetition does not alter the fact that medical science does not know the cause . . . of lung cancer."

If Dr. Cole knows what will happen in the field of cancer 20 years from now, he apparently has information not generally available.

—A group of researchers wrote in the Journal of the American Medical Association on Sept. 24 that filtered cigarette smoke yielded only one-third the amount of tar in standard cigarette smoke but still enough to cause cancer in some mice. They said each of six brands they studied induced tumors in the mice and some of the tumors became cancerous.

—The Tobacco Industry Research Committee (TIRC) chairman, T. V. Hartnett, replied to the filter-tip report that "scientists advise us that

it is important to note that cancers have been produced in laboratory animals with a number of harmless, everyday substances, including glucose, eggs and medicinal skin creams. It is apparent that animal skin painting is not directly relevant to the problem of human cancer, particularly lung cancer."

Against this backdrop of controversy, the carefully chosen scientific panel, guided by the nation's chief health officer — the Surgeon General — will search for new insight into the age-old tobacco-health debate.

SEARS
ROEBUCK AND CO

SHOP MONDAY AND FRIDAY NITES 'TIL 9 P.M.

PROOF of VALUE!

More People Buy Bedding at Sears Than Anywhere Else in America. There Must Be a Reason . . . Check the Features . . . Compare Our Low Prices! . . . and No Bedding Carries a Finer Guarantee.

312-Coil Mattress, Springs
Sensitive balanced-coil design resists sagging. Has pre-built borders, cushiony insulation, 216-coil twin.

49⁸⁸
Full or Twin Mattresses or Springs

Sanitized Sleep Set
220 coils to full size, 160 coils to twin size. Cotton and rayon cover, vertical stitched, quilted cotton prebuilt border.

39⁸⁸
Each Piece
Twin or Full

Sears Foam bedding is cool, odorless, lightweight and nonallergenic.

"Bench Built" 527-Coil Mattresses or Box Springs
Scientifically built, mostly by hand, to give you firm soothing support. No sagging, thanks to our coil-on-coil design and pre-built border. Heavy woven cover.

39⁸⁸
Full Size Only

Compare! 6-Inch Foam Latex Mattresses With Quilt Tops
Not the usual 4 1/2-in. foam mattress, but a 6-in. genuine latex. Extra firm and long wearing. Puff-quilted cover of gold rayon bridal satin.

129⁸⁸
Full Size 159.88
Twin Size Combination

Sears-O-Pedic 720-Coil Unit
Resiliently firm and so kind to your back. Has springy rubberized hair padding, rimmed border. Durable coil-on-coil design. 504-coil twin.

77⁸⁸
Full or Twin Mattress or Spring

Luxury-Quilt Serofoam Mattresses
Softly firm coil supports you firmly and evenly. Quilt tops add luxurious softness. Printed beige covers.

99⁸⁸
Full Size 129.88
Twin Size

Complete Bunk Bed Unit
Sears Low Price **109⁸⁸**
Bunk bed complete with ladder, guard rail, two complete bunkie units.

Easy-to-Open Fold-a-Bed With Coil Spring Base
Sears Low Price **49⁹⁵**
Compact comfort! 39x75-inch bed with 3-position head adjustment. Coil springs give added resiliency. Beige baked-on enamel finish. Innerspring mattress.

ARMY ON MOVE—In response to President Kennedy's order concerning the "quarantine" of Cuba, the southeastern part of the country has been literally jumping with military movement. Shown above is a troop and equipment train moving to bases south of Oak Hill, Fla., with some 10 cars of troops and additional cars, with armed guard on top, center of picture, carrying artillery guns, ammunition and trucks.
