Why Water Quenches Thirst. Thirst, a word of Anglo-Saxon origin and akin to the Latin torreo and our torrid or parched, describes a peculiar sensation of dryness and heat located in the tongue and throat. Artificial thirst may be produced by the passage of a current of air over the mucous membrane of these parts, but normal thirst is the consequence of a lack of liquid in the system. The agony of extreme thirst is due to the fact that all the tissues sympathize in this distress. It is then as a refreshing relief that a supply of water comes to thirsting lips, replacing what has been lost, cooling the parched palate and rapidly removing the craving which has depressed the system. In short, water quenches thirst just because it supplies could properly compare the gift of ber. advent of good news.
