# New Window Resists Atom Bomb Effects

PITTSBURGH—The new Flex-seal Bomb Glass units open automatically in four triangular sections when an explosive force strikes. This release of pressure prevents the window frame from being blown in and greatly reduces the possibilities of flying fragments.

The window consists of three layers laminated into a single unit. The outer layer is a sheet of glass, the middle layer a sheet of polyvinyl butyral plastic, and the inner layer is four triangular shaped pieces of glass. The plastic layer extends beyond the glass edges and is bolted to the window frame to serve as hinges, permitting the four segments to open like doors when the outer plate of glass is broken.

After an explosion of sufficient force to open the bomb window, the four segments may be returned to position and retained there by a bolt, as shown above, or even a wad of chewing gum. The crevices may then be closed with adhesive tape, putty, clay or whatever is handy, and the restored window again affords protection from cold, rain, storms, etc., until such time as the glass may be replaced.
