NU-METHOD
24-HOUR SERVICE
Mill City
Closes at 6 P.M.

Knowledge is Power

1. ARE YOU A SUCKER FOR HIGH-POWERED ADVERTISING?

2. CAN PRE-HISTORIC EVENTS BE MEASURED ACCURATELY?

3. WHAT IS A BUFF?

(1) If you are, try two simple devices for offsetting the ads you see and hear. Rudolf Flesch suggests them in his book, "The Art of Clear Thinking." He calls them "So-what?" and "Specify." You use the first question on irrelevant points in the ad which should be dismissed, the second for relevant points which are missing from the ad. Apply these to the next ad you see or hear. For instance—"The Countess of Carnarvon uses Angel Face Make-Up." (So what?)

(2) Accurate measurements can be made with the aid of atomic science. Using a Geiger counter and an oscilloscope, scientists can measure the rate of disintegration of radiocarbon remaining in trees and other matter which was once organic. The oscilloscope has a screen very much like that of a small TV set. This disintegration produces green zig-zags on the oscilloscope screen. Radiocarbon disintegrates so rapidly that some 5,000 years after a plant or animal has died, the radiocarbon it once contained is half gone. This new atomic calendar, reports "Natural History Magazine," is reliable in establishing historical dates as far back as 15,000 years ago.

(3) A buff is a person who rushes to the scene of a fire to watch the strategy of the firemen as they battle the blaze. Some famous buffs—Arthur Fiedler, Boston "Pops" Orchestra conductor; Winston Churchill, Al Smith, Fiorello La Guardia and George Washington. The "Nation's Business" reports that there are about 50,000 buffs in the U.S. now, and some of them are organized into buff clubs.

From articles in the March "Catholic Digest"

There's Gold In Your Farm Woodlot

No. 5 (Fifth of a series of six articles on second-growth forests as a cash crop, prepared by private, state and federal forest agencies)

When your trees have passed their period of most rapid growth (about 80 years), the best policy is to clearcut and start a new crop either by natural seeding from close by mature trees or by hand planting. You should also clearcut woodlots where repeated thinnings have finally left too few trees.

Ordinarily the species growing on your land, generally Douglas fir, is the one best suited. Douglas fir reproduces best on clearcut areas. Seedlings like the shade of weeds and light brush to start, but when once established need plenty of sunlight. If the clearcut area is small, from 2 to 20 acres, and it adjoins or is surrounded by seed-bearing trees, it will reforest promptly by natural seeding. Fire must be kept out and stock fenced out. If there is a good seed crop right after logging the area will come back fast.

If you have had a good seed year you may want to leave your slash and provide better fire protection. Otherwise you will want to burn your slash the first time it's safe to do it and put your land in shape for the next tree crop.

If your land tends to grow brush, you will want to hand plant immediately to give your valuable timber crop a chance to get started before the brush slows it down. Even without brush, natural reforesting takes from 2 to 10 years, so you may want to get your crop of trees in quickly with nursery stock. Trees can be obtained from the State Forestry Departments of Oregon and Washington and some companies will supply nursery-raised seedlings to farmers. Winter planting is best and it comes when the farmer has the most free time.

Hand planting of seedlings requires some thought and care. A simple mattock, one of the hoe-type of tools, is all a tree planter needs. With one stroke of the mattock a suitable hole is opened to admit the roots of the seedling. Care should be taken to avoid leaving air space around the roots; to see that roots are straight and not turned up, that the tree is not too deep and that ground cover won't choke it out. Plant seedlings to get advantage of natural shade of stumps, down logs.

If you plant 4 by 4 feet spacing you will need 2720 trees per acre. Ideal is 6 by 8 foot spacing using 910 trees per acre, although some prefer 8 by 8 with 680 trees. Trees cost about \$5 per thousand. Next we will discuss logging, land clearing, interesting facts.

(For more particulars write your State Forester at Olympia, Washington or Salem, Oregon for your free copy of "YOUR TREES—A CROP," how to grow and harvest them in the Douglas fir region.)
