Is your water heater too slow?

Free information on new high-speed electric water heaters.

If your present water heater is several years old, chances are it heats water much slower than the new electric ones.

High-speed models have a 4000-watt (or more) element sealed in the water near the top of the tank. Another 4000-watt element is at the bottom. Water is heated two, three or even four times faster than in old models.

Yet new quick-recovery electrics take up no more space; cost no more to buy, install or operate. And, of course, they are

flameless, safe and clean. No wonder 90% of all new homes and apartments built last year in the 5-state area we serve chose electric water heaters!

Mail the coupon and a Pacific Power water heating specialist will call to explain the advantages of the right electric water heater. We don't sell equipment—only advise on how to get the most for your money.
