It is known that a person hunting in the winter time should be careful not to run the muzzle of his gun into the snow, lest the end of the bore become filled with snow and the gun burst when fired. While the snow would be almost infinitesimal in weight, it would have to start instantly into motion, at the rate of perhaps a third of a mile a second, when the powder is ignited. While it may be hard to realize it, more force would probably be required to accomplish this result than the strength of the gun barrel could stand, and the barrel would rupture under the strain.
