U S.LAND OFFICE.	Paper manufacturers and users of

be interested in a successful process which is said to have been discovered for making paper from cotton stalks, cottonseed bulls and other portions of the cotton plant. Stress has been laid of late upon the enormous loss which U. A. Kenart has been sustained annually through 1.500,000 tons of cotton stalks, in view of which the new process will be welcomed by those who favor a conservathose who are merely interested in which proposes to manufacture paper from the new material has been incorporated at Atlanta, Ga., under the title of the Southern Cotton Stalk Pulp and Paper company. It is claimed by the new company that paper can be manufactured from cotton stalks much more cheaply than is possible in the wood pulp mills of the country, while it has been estimated that if all of the cotton stalks produced in the country were utilized in the manufacture of paper it would keep 1,500 mills running night and day through the year, each turning out twenty-five tons of paper a day. From the standpoint of protecting our forest interests as well as the economical disposal of what up to the present has been a useless byproduct it is to be hoped that the new enterprise will

OVERREACHED AND LOST.

The holding of farm produce for a higher price when an already high price is obtainable partakes often of the nature of a speculation and is likely to result in serious loss. This point finds illustration in the case of a bunch of north Iowa farmers who two years ago held their wool for a higher price when they could have realized 28 cents a pound for it. In their opinion this was not enough. The next season the price of wool dropped to 16 cents. They still held their wool in the hope that the high price of the preceding season would prevail, but it did not. This year, after having had their money tied up in their clip two METHODIST EPISCOPAL CHURCH-THE first Sunday in each month, preaching at 11 a.m. Aside from this, preaching every Sunday at 11a.m. and 7:30 p.m. at Lakeviaw a dozen times perhaps a fellow can Sunday School at 10 a.m. Largie at 6:30 p.m. Prayer Meeting Thursday 7:30 p.m. win out on a speculation of the above Ladies Aid Wednesday 1:30 p.m. Choir type, but the other eleven he will be a practise Friday 7:30 p.m. A cordial invitaa dozen times perhaps a fellow can loser. If in any given season the price tion is extended to youn.

I. C. PARKER. Pastor. of a product is less than the average for a period of ten years, it will be FIRST BAPTIST CHURCH OF GOOSE LAKE fairly safe to hold on to it provided at New Pine Creek, Oregon. Preaching services at 11 A M and 7:30 P M of each Sendar of every month. Sunday School at 10 A M Prayer Service at 7:30 on Wednesday evening of each weed. All are condisily invited to good judgment would dictate the wisattend he services.

MICE IN THE ORCHARD.

The season's work in the orchard is not done until piles of grass and litter have been removed. If this is not done they are almost sure to become harbors for mice, which will work havoc with the trees in case they are hard pressed for food during the winter months. Last fall after apple harvest we removed a number of cocks of rain spolled grass which had been in the orchard three or four weeks, and in almost every one was found a squirming brood of newborn mice which would have grown a coat of hair before winter and would have had to have some form of food supply during the winter. It is well in this connection to remember that mice will girdle a ten-year-old tree just as soon as they will one three or four; hence there is additional reason for precaution. Where the number of trees is not large the trees may be effectively protected from the attacks of both mice and rabbits by wrapping the trunks with wire screen or pieces of wood veneer which are made especially for this purpose. Whatever protection is given the trees, though, a warfare should be waged on the mice.

SHOULD HAVE IT ON EXHIBITION A lady reader of these notes offers the suggestion that, since there are so few farmers who know what quack grass is when they see it, it would be a commendable thing if the officers of county institutes would see to it that when their winter sessions are held specimens of the grass showing seed head, leaf and root systems were exhibited and the habits and characteristics of the plant given a somewhat or hard work for the man and thirst full exposition. The suggestion is an on the part of the beast. When not excellent one and should be acted upon in fast as many cases as possible. In be used for turning the separator, all too many instances the only acquaintance a fellow has with this worst churn, sawing wood and for other of weed pests comes through its getting a foothold on his land and the war of extermination he has to wage to get the test the more highly are they rid of it. Did he know the grass from prized. the start be might stamp it out with = relatively little effort before it became established. Not only should there be a discussion of quack grass in the in-

Some recent experiments conducted by the Michigan experiment station attach a relatively high value to bright oat straw as a roughage in the fattening of sheep.

That boy and girl are deserving of pity rather than censure perhaps who are more concerned about the dirt on their linen than the tarnish they may bring upon their good name. In this case it requires something besides soap and water to remove the spots.

Eternal victiance is the price of liberty. The same kind of vigilance is required if a fellow is going to have any success in the growing of vegetables, apples, grain or live stock. He is confronted with many drawbacks and problems which require his best care and thought if he is to succeed.

Before the ground freezes hard it is well to lay by a good supply of fine road dust for the hens to bathe in during the winter months. It is also a good idea to secure several barrels of leaves and grass or other fine litter where stock is not kept on the place. so that the poultry will have something to scratch in.

Experiments which have been conducted by the department of agriculture show that the dairy barn should be so constructed that there will be four square feet of window glass for each cow and large enough so that tion of our forest resources as well as there will be 500 cubic feet of air space for each animal. It should have buying cheaper paper. A company inlets and outlets for air, but the ventilation should be so arranged that cows will not be subjected to drafts.

oleomargarine manufacturer should not try to associate on terms of equality with the dairy cow. There is nothing square, honest or legitimate in the attempt which the makers of oleo are putting forth to have their steer grease pass muster as gilt edged dairy butter. As far as wholesomeness is concerned, oleo is probably all right, but it should sell as such and not as dairy or creamery but-

The stand patter in politics doubtless at times serves a useful purpose, but the fellow who still plants his taters by the full of the moon, selects his seed corn at busking time, doesn't test his dairy cows to weed out the loafers and has not yet awakened to the advantage as well as the necessity of a sensible system of crop rotation is still living in the agricultural dark ages and is a foe to civilization and progress, as well as a block in the way of his own financial advancement.

In these days, when it is difficult and at times well nigh impossible to get the belp needed at husking time, the hog raiser has an additional incentive for hogging down his corn. Instead of this being a slipshod and unbusinesslike procedure, it has been determined in a few tests conducted by the Minnesota experiment station that hogs fed in this way gained in flesh much more rapidly than a like bunch kept in a feed lot and having the corn picked and thrown to them. Where the fields are properly fenced and there is any money at all in the feeding of corn the experiment would seem to be well worth making.

While the state of Iowa is a leader in many commendable agricultural sely the lands described, or desiring lines, she falls down badly when It comes to a utilization of the vast amount of roughage which grows to maturity every year in her 9,000,000 acres of cornfields. While it has been found that a ton of well cured corn fodder contains as much nutritive value as a ton of timothy hay, it is lished in the Lake County Examiner, estimated that up to the present not more than 5 per cent of this vast amount of fodder is cut and utilized annually in the most effective way. A radical reformation must be forthcoming if Iowa is to live up to her agricultural opportunities.

When the sensible young fellow really begins to think seriously of the important question of establishing a home of his own he has his weather eye open for the girl who knows or has wit enough to quickly learn the practical work in the home, who is modest and gentle, who is kind and thoughtful and her mother's right hand "man." It is these considerations and not the cut of her dress, the "do" of that she may put on her face that apter Howard and Guy W. Rice, of her hair and the amount of powder peal to the masculine heart. Now and then a fellow is flimflammed by these subterfuges, but he can hardly be placed in the sensible class.

One of the uses to which a gasoline engine may be put was nicely filustrated during the recent extensive drought. In the many weeks of dry weather there was often a dearth of breezes to turn the windmill, with the result that this work had to be done by hand or the stock went short on water. In such cases a two or three horsepower gasoline engine which might have been called into service would have done the pumping at a slight expense and saved a whole lot used for pumping such an engine could shelling and grinding corn, running the purposes. The more the merits of reliable engines of this type are put to
