## READ YOUR HOME MERCHANTS' ADS

**Many Bargains Are Overlooked by Failing to Read the Advertisements**

Someone has said "to have your wife become an advertisement reader is better fortune for you than an increase of salary." There is some sound logic in this statement and the Examiner agrees with the man who invented it. It is further stated that the ad-reading housewife makes the family expenses money go farther, makes it buy more and better things, and in the course of a year will have saved a surprising sum, without curtailing home supplies.

The ad-reading housewife simply applies business methods to buying the needed home supplies. By reading the ads she learns when, where and how much to buy at a time. These are more facts that should be heeded by the conservative housewife. The habit of wise buying practiced by ad-readers exclusively lends to wise and systematic and frictionless management of all home routine and affairs.

It is fair to contend that the public in general who do not read the ads of their local paper lose more than the merchants and other business houses that spend money for advertising when their ads are not read. In these sad days it is conceded that a store which has anything to advertise will advertise it fully and informatively. So, when a store's ad is missing from the paper, the reader assumes that nothing special is happening at that store at that time, which conclusion is usually right.

Never lay your paper away until you have thoroughly scanned the advertisements. You may find bargains just as alluring in your home merchants, as you have seen in some mail order catalogue. And besides you will not have to send the money out of the country where you have acquired it, to buy something unseen.

### All-Night Dance

An all night dance will be given by George Lewis Friday night, June 14, at the 70 ranch in Drews Valley.

George promises that everyone who attends will be assured of a good time, as nothing will be left undone to warrant this success. A cordial invitation is extended to all. Good music will be provided and a genuine jolly time is promised.

### Forester Officers

At a meeting of the Ancient Order of Foresters, held Monday evening, the following officers were re-elected to serve for a term of six months: J.P. C.F.—William McCulley; C.R.—Harry Vernon; S.C.R.—John Arzner; F.S.—Rial Striplin; R.S.—Dan Brennan; Treas.—Tom Bernard; S.W.—Joe Arzner; J.W.—Sim Arthur; S.E.—X. Arzner; J.B.—S. F. Ahlstrom.

A brief talk was given by Rial Striplin, who told of the business transacted at the meeting of the Grand Convention held several weeks ago at Fresno, and to which he was a delegate. Refreshments, brought here from California by Mr. Striplin, were also served during the evening.

## SEWER PLANS PREPARED

Continued from first page  
plant and also for a storm sewer to replace the present wooden flume.

The separate system of sewerage, which is designed only for house sewage, and into which surface and storm water is to be excluded, has been adopted for the following reasons:

Smaller pipe can be used, thus making a large saving in cost.

Practically eliminating the necessity for flushing.

Decreasing the size of the Disposal works necessary.

And finally, the fact that the sewage will be treated practically forces the use of the separate system.

The size of pipe, etc., has been based upon the assumption of a normal flow of one hundred gallons of sewage per capita, per day with allowance made for a maximum flow of from two to three times this amount. The total population and its density has been worked up for a total of approximately 10,000, which is thought to be a reasonable limit for a period of 20 to 30 years. That is to say, that sewer pipe has been made of size sufficient for future connection to be made that would serve a population of this size.

Special attention has been given to secure a system of self cleaning velocities that would eliminate the necessity for flushing. To this end, the grades have been uniformly held to produce this and a small sized pipe as practical, to cause depth of flow, has been used. Nothing however, less than six inch pipe has been provided in streets and alleys. The connections from the houses to the curb line should be four inch pipe and should be on a grade of not less than two feet in 100 feet, more if possible. The proper system of plumbing at the house, with air vents, grease traps, etc., should be compelled. These matters should be fixed by a proper ordinance and strictly enforced. If these provisions are properly carried out, there will be no necessity for flushing, except, perhaps that, once in a great while, the sewers in that portion of town, that at present is thinly populated, should receive an occasional flushing. The method used should be to simply stop up the lower outlet of a manhole, fill the manhole with water, and suddenly discharge the same. After the population tributary to the sewer has increased the necessity for this will be lessened.

The only sewers in the system proposed, that have grades less than that required for self cleaning velocities, are the ten, twelve and sixteen inch pipe, which runs from Walters Street to Cogswell Street, west of Pine St., and from there into the disposal works. This section should receive an occasional flushing especially during the dry season, but the total amount thereof will be comparatively small. Perhaps a maximum of 2000 gallons per month would be amply sufficient, and most of this could probably be taken from Bullard Creek, when it is running. 2000 gallons per month would be about equivalent to one ordinary bathtub full of water per day.

The Disposal works have been located upon the Southwest corner of the Race Track property and its design has been based upon the assumption that an average of 75 gallons of sewage per capita per day will reach the

outfall and they will accommodate a population of 2500. The method of treatment adopted is to first pass through a grit chamber, where all mineral substances, paper and other matters that would interfere with septic action are screened out; thence it passes into the septic tanks, which are designed with the idea of retaining the sewage there for eight hours, and their contents therefore are 6,300 gallons. From the septic tanks, it will flow over wires, into a dosing tank, with a capacity of 21,000 gallons, which is equal to the capacity of one filter bed. The sewage is held in the dosing tank until it is full, when it will be automatically discharged into one of the filter beds, by an automatic siphon. There are three of these siphons and are so regulated, that they discharge alternately, thus filling each of the three filter beds in rotation and each bed will be filled and discharged three times in twenty-four hours. The filter beds will be filled and stand full for a certain length of time, approximately four hours, which is regulated by ten inch timed siphon, so that when this time has expired, it will automatically discharge. The effluent from the filter beds should be from 80 to 90 per cent pure, which is considered good enough for all practical purposes.

The single contact filter has been decided upon as being the cheapest to construct, freest from freezing in winter and most adapted to local conditions. A sand filter produces a slightly purer effluent, but the beds would have to be from three to four times as large, thus costing considerably more, is more subject to ice troubles in winter and further, the discharge of the entire bed at one time under head, is preferable to a gradual discharge under the circumstances.

The whole system is thought to be the cheapest possible, to obtain the results thought necessary and if properly constructed and operated, no nuisance need be expected.

The difficulty encountered in the design of the Storm sewer, was to make a safe provision for rock that comes down the canyon and to overcome the excessive grade from its intake to its outlet, and it is thought that both of these difficulties have been overcome in a practical manner.

In regard to the proper cost of the system, it is somewhat difficult to arrive at this with perfect satisfaction, since we have no local work of the same kind to judge from, but the following is thought to be a reasonable estimate of the cost of the same:

Pipe Sewers.....	\$42,000
Disposal Works.....	9,000
Storm Sewer.....	17,000
Engineering.....	2,000
Total.....	\$70,000

The design has been based upon the use of strictly first class material and first class work in every particular, and all novel and untried experiments have been eliminated. It would be but justice to the large amount of time and care put upon the designs and specifications, to remind you that their construction should be under careful and competent supervision.

Respectfully,  
G. W. RICE.

Sprains require careful treatment. Keep quiet and apply Chamberlain's Liniment freely. It will remove the soreness and quickly restore the parts to a healthy condition. For sale by all dealers.

## FIRST WOOL IS SHIPPED BY RAIL

**Eight Car Loads Gone Out This Week and Much More to Follow**

The first wool ever hauled from Goose Lake Valley by rail was taken out this week. Two car loads went out the first of the week and six car loads will be hauled out today. The wool clip this season promises to be heavy and an enormous amount will be ready for shipment before long as the various flocks throughout the county are being shorn quite rapidly.

Wool has brought a good price this year and that together with quantity, will place our sheepmen in general in a most jubilant mood. Now that we have a railroad it will not take very long to take out the wool, compared with the former way of transporting it out on wagons.

## JUDGE BENSON'S OPINION

Concluded from page 4.  
teeth on the base of the tongue. The color varies greatly, but is usually dark gray, with numerous well separated rounded spots of lighter gray."

17 Cyclopaedia, Americana, subject "Salmon Trout", and again the same authority says this:

"Put your finger in the mouth of your capture, and if you find the vomer, a bone situated on the front part of the roof of the mouth, flat, with teeth on its body, and behind these an irregular, single or double series of teeth, you hold in your hand a salmon trout."

19 Americana, subject, "Trout." But even then, this Court is not convinced that the fish were Salmon trout. However, since the burden of the proof is upon the State to establish the guilt of the defendants beyond a reasonable doubt, and since, upon the evidence there exists such a doubt, the Court is compelled to find that the complaints is not sustained by the evidence, and the defendants must be found not guilty and their bail exonerated.

It is proper to say, however, that this decision must not be regarded as a precedent, and it does not follow that another case, in which the Court has further evidence and information in the premises, would not result very differently.

If the fish which were taken by the defendants in this case were not a game fish, and are not protected during the proper seasons by the laws of the State, then in the judgment of this Court, some steps should be promptly taken to amend the laws.

Monday, being her sixteenth birthday, a large number of the friends of Miss Emma Arzner gathered at her home on Slash street and gave her a genuine surprise. The "G. G. G." and "Philadelphians" were prominently represented among those present. Games were played during the evening songs sung, refreshments served and a very fine time was enjoyed until about 2 P. M., when the guests left for home.
