

The part that fine steels play in a MAXWELL

There is a definite reason for the brilliant performance of a Maxwell car. Lift the bonnet and you see the simplest of engines. Examine clutch and gears, and you see supreme simplicity. The definite reason for Maxwell performance and endurance is the fine steels, those steels built to Maxwell's own formulas, that combine quality and rare strength, that defy time and the repairman. This is the story of the Maxwell, the real cause for brilliant performance and long endurance. These steels do not burden the engine. They make its tasks easier. They flatten out a hill for the engine. The combination of light weight and great strength—the ideal of Maxwell construction—is thus achieved. And to obtain that rare combination of strength with quality means costly steels. So you will find that, pound for pound, the steels in a Maxwell equal those in any car built. That is why the rise of Maxwell has been so marked; why nearly 400,000 have been built; why 100,000 are being constructed this year; why these will fill but 60% of the demand.

NOTED OLD SALOON CLOSES FOREVER

SAN FRANCISCO, Apr. 6.—The Bank Exchange saloon, the bar, flag stone floor and fixtures of which were brought "around the Horn" in the gold rush days, is closed. Duncan Nicol, known to men and women tourists from many parts of the world as "Pisco John" because of the famous punch he served, sold out several months ago. His successor, John Lanner, has given up after a futile effort to continue the place on soft drinks and its reputation as a rendezvous for bon vivants since 1853. Lanner said he intends to present the saloon's collection of quaint old prints and engravings to the Golden Gate park museum.

PINE BEETLE ALSO RUINS B. C. TIMBER

MERRITT, B. C., Apr. 6.—A formidable enemy to British Columbia timber resources has been found in a small brown beetle, an eighth of an inch in length, known by the scientific name of dendroctonus, according to forestry officials here. The beetle, according to scientists, bores through the bark of pine trees and burrows in the sap wood. In two or three years the tree is dead. So far as known, the only method of controlling the pest is through cutting down and burning infected trees.
