Radiograms

Peculiar Case Noted Cases have been noted, in navy short stations, where lightning jumped from a grounded switch a foot and a half to an open transmitter contact. To take care of this adequately, the best form of antenna is a trolley type, where the antenna can be separated several feet from working contacts, or else a long switch on a pole, which will carry the antenna rattail direct to ground a number of feet from the building. This is only the exceptional case, however.

Church to Install Radio

Ridgford, Washington, will soon have a radio receiving station for the public which will be capable of both short and long distance service. It will be installed in the main auditorium of the Community church and according to the announcement of the Rev. George V. McClure, pastor, sponsor for the innovation, the apparatus will include an amplifier. Entire equipment has been ordered and it is expected to arrive within the next two weeks. This church, it is said, is the first in the Pacific northwest to install a radio receiving apparatus.

Spark Gaps Bring Safety

For combined transmitting and receiving stations, an outdoor grounding switch must be used, though, to give protection to the receiver against lightning, it is an excellent idea to shunt the primary circuit with a spark gap or vacuum device permanently, in addition to a grounding switch outside. This switch should be double throw, with the antenna connected to the middle point, one side leading directly to ground and the other side to the transmitter.

Way to Make Spark Gap

A protective spark gap for a receiving antenna can easily be made at home. The underwriters' rules require that it shall be made of brass or copper, not less than one-eighth of an inch thick, of surface dimensions not less than two and one-half inches in length, parallel to the gap, and one and one-half inches the other way, and that the gap be not more than 0.015 inches between opposing faces. This is to be mounted on approved insulation, which is non-combustive, non-absorptive. For minimum safety, this gap should be mounted out of doors, and by housing it in a suitable wooden box it can be protected from rain and snow.

MORE COAL IS MINED

Production Showing Slight Increase, Report Indicates WASHINGTON, D.C., April 19.—Coal production in the United States, reduced by 75 per cent when miners in unionized fields walked out April 1, is now showing a slight increase. It was reported today by the geological survey. Non-union fields where operations are continuing produced 10,720 carloads Monday, April 16, and forced slowly ahead on each succeeding day until Thursday, April 13, the last day recorded, when the output was 11,480 cars. The production on April 13, though less than districts now at work are able to produce when demand is active, the survey said, was the greatest of any day since the strike began. On Monday, April 3, production was 11,455 carloads, but in the next few days output even in non-union fields fell off.
