Marilyn Monroe Proves Top Box Office Earner

HOLLYWOOD (AP)—Marilyn Monroe, who has won citations from many Army and Navy units, today was awarded box office honors too.

She was named among the top 10 money-makers of the screen.

Hollywood's sexiest dish was chosen among the winners by the Motion Picture Herald's 22nd annual exhibitors' poll, the most accepted in the field.

Here are the top 10 in order:

Gary Cooper, Martin and Lewis, John Wayne, Alan Ladd, Bing Crosby, Marilyn Monroe, James Stewart, Bob Hope, Susan Hayward and Randolph Scott.

The poll points up the fact that Hollywood has been lax in developing new stars. Monroe is the only new name on the list, which is dominated by male stars of action films and musical comedy.

The next 15 money-making stars placed in this order: Doris Day, Esther Williams, Margery Main, Percy Kilbride, Gregory Peck, Ava Gardner, Clark Gable, Burt Lancaster, Jeff Chandler, Jane Wyman, Abbott and Costello, Stewart Granger, Jane Russell, Charlton Heston, Humphrey Bogart and Rita Hayworth.

The selections of top western stars showed the dearth of horse operas for the program market. In former years the top 10 were chosen. This year only five were named: Roy Rogers, Gene Autry, Rex Allen, William Elliott and Allen (Rocky) Lane. Neither Rogers nor Autry, who have shared the one-two position for many years, is now making theatrical films. Both are active in TV.

AMNESTY

TOKYO (AP) — Fifty-two Japanese, once sentenced to death as war criminals, walked out of Tokyo's Sugamo Prison free men Wednesday under an amnesty granted by outgoing Philippine President Elpidio Quirino.

Scientists To Study Life Of Atom, Watch Process

Associated Press Science Reporter

PALO ALTO, Calif. (AP) — Scientists are well on their way toward being able to see and photograph small molecules and even individual atoms, the American Physical Society was told Tuesday.

They may be able to observe what takes place when a catalyst breaks down one chemical compound to form another—a reaction widely used in industry but little understood. They may see the geometrically interesting lattices formed by atoms in making crystals.

These prospects were reported by Dr. Joseph Henderson of the University of Washington, Seattle, and Dr. W. W. Dolan and Dr. W. P. Dyke, of Linfield College McMinnville, Ore.

Best bet for getting a look at the atom, Dr. Henderson said, is an instrument called an ion microscope. It uses the cores of hydrogen atoms as its "light source." It is being developed mainly by scientists in Germany, Dr. Henderson said.

The ion microscope works by smearing hydrogen atom cores on the face of the atom or molecule to be observed and then pulling the cores off with an electrical charge. As they leave the subject atom they spread out, just as light is spread out when reflected from any spherical surface. A film or fluorescent screen catching the spreading beam of hydrogen cores is exposed or activated with the enormously enlarged image of the atom ever will be seen.

With this instrument scientists should be able to see an object as small as a hundred millionth of an inch in diameter, Dr. Henderson said. This is small enough to include individual atoms, most of which are supposed to be a fifth-millionth to a hundred-millionth of an inch across. Some American researchers have reported getting pictures of large molecules but have expressed doubt that a single atom ever will be seen.

Dr. Dolan and Dr. Dyk reported on a method for increasing greatly the power of the electron microscope. This work, sponsored by the Office of Naval Research, involves the production of electrical charge as in conventional scopes.
