natural in her," he said, adding that her color sense is her best painting asset.

Theresa's mother, Nina, a Polish refugee, does not paint. But her sister, Eugenia, 1, may follow the trend.

"Just look at this," Keller said pointing to Eugenia's pencil scribbles on the studio woodwork.

A half dozen unsigned works by Theresa hang in the studio now. Keller plans a full exhibition in about three months.

"When someone comes in and buys a painting we guide her hand to sign it," he said.

Will she continue? Keller seems to think so. Theresa isn't too sure.

"There's too much time to wait yet," she said, adding that dancing and being a nun were possible future careers.

Research On Plants Medical Aid

OREGON STATE COLLEGE—Use of plant growth stimulators, such as gibberellic acid, will increase the yield of medicinal plants, an Oregon State College pharmacist has found, but more important may help provide an insight into exactly how medically-valuable compounds are formed within plants.

By knowing exactly how these compounds are formed in the living plant, it might be possible to increase yields tremendously by giving the plants a special "fortified fertilizer diet," says Dr. Leo A. Sciuchetti.

Sciuchetti is one of the pioneer workers in the U.S. on the influence of plant growth stimulators on medicinal plants. He is concentrating on plants that contain alkaloids, especially those producing atropine and hyoscyne. Atropine is used in eye drops, for treating ulcers, diarrhea and other stomach conditions. Hyoscyne is closely related but also has a "tranquilizing effect."

Three student assistants working under Sciuchetti on the project have won top national awards for their research reports during the past two years. Two special National Science Foundation grants have been received to provide student research help during summers. Grants-in-aid from the OSC graduate school help support the studies.

Belladonna and Jimson weed—common American medicinal plants—are being used in the work. Growth stimulators studied include gibberellic acid and kintin, a new stimulator which causes an increase in plant cell division.

Sciuchetti has plans to combine some radioactive materials with the growth stimulators so they can be traced within the plant. He is hopeful of finding new information on how a plant is able to produce the active components of these drugs.

Students who have won recognition for themselves and the college with their award-winning papers include Arle Scott of Keryby and Edward Caldwell, Portland, 1960 graduates; and Robert E. Brummett, Corvallis, 1959.

or reaccredited, well within schedule.

The new brand book was put out. It is released once every five years. This year the book holds brand records of almost 10,000 owners for horses, cattle, sheep, hogs, goats and poultry.

Oregon's coastal fishermen turned down a proposal to create a Sea Food Commission and ryegrass growers rejected a self-help program. Aiding the department in its efforts to obtain an adequate cranberry crop reporting service, Senator Wayne Morse advised that he has been pushing for crop reporting program at the national level as an aid to Oregon growers.

Bread To Beetles In 1960 Top Agriculture Stories

Bread, brucellosis, bees, Bang's, beef and beetles were all part of the 1960 news year for the state Department of Agriculture.

James Short, director of agriculture, took his post in April from retiring Frank McKennon. Short made news recently with reorganization plans approved by both the State Board of Agriculture and Gov. Mark Hatfield.

The well publicized proposals will not, according to the director, add new responsibilities or duties. "We have simply developed a realignment of the staff to meet present day responsibilities," he said.

Short earlier separated veterinarian services from under the Division of Animal Industry, made veterinary work a division of its own, and put both divisions under his direct supervision. Dr. L. E. Bodenweiser was named chief of the new division of veterinary services.

Livestock leaders and private veterinarians gave Short a vote of confidence on animal activities reorganization.

In another action of 1960 the department went on record as against suspension of reduced railroad grain freight rates.

Other department news was created when the only pine stock in Oregon infected with the European pine shoot moth was destroyed. The Dutch Elm bark beetle was found in Klamath County. Officials said that in the spring another survey would be made though no Dutch Elm disease has yet been located. A round-the-clock watch was placed at the Portland-Klamath Falls airport for possible entry of the Japanese beetle, (none got in alive). The last of the '59 crop of Willamette Valley sugar beet seed was planted in West Germany.

Other states requested information from the Oregon Department of Agriculture on ragweed. Its control program was said to be "head and shoulders" above other states. After 35 years W. L. Close retired as the federal supervisor of shipping point inspection, succeeded by Pat Murphy from Michigan.

Other long-time department officials retiring included W. E. Upshaw, manager of the branch office in Portland; and Ross Aubrey, shipping point district head at Klamath Falls.

In fresh fruit and vegetable inspections, carlot equivalents dropped 15 per cent to 36,557 cars but platform inspection increased 40 per cent to 282.1 million pounds. The department checked out 30,100 barrels for the government in federal cranberry disposal program.

Bee inspectors reported an alarming increase in American foul brood disease in some localities. O. K. Beals, head of the Foods and Dairies, Weights and Measures Division, Short announced, will be an assistant director under the reorganization. Chemist James Laumer topped the nation for the fifth year in work on chemical analysis of feeds. The state department, after public hearings, refused petitions of a national dairy concern to add lactose to milk or milk products sold in Oregon and of an Idaho firm to add more vitamins to milk. Also, standards of identity of fluid milk and milk products were established.

Sparked by appearance of the "balloon" loaf of bread, the department revised, following public hearing, sizes of bread pans Oregon bakers may use. Dr. M. L. Houston, supervisor of meat inspection, told meat packers that state inspection for the first time accounts for more than half of the total red meat slaughter poundage in Oregon. Greater emphasis, through new regulations, was placed on sanitation of poultry and rabbit slaughter establishments. The department inaugurated an efficient back tagging system to be used in Bang's and tuberculosis traceback programs, thus lowering control costs. Reduction in Bang's infected breeds continued and Bang's and TB due counties were recertified,
