ALL SHOULD HAVE PLENTY OF MILK

Bones and Teeth of Children and Adults Need Milk in the Diet

Two famous nutrition authorities emphasize the need of the human body for the calcium and phosphorus found in milk. Children and expectant or nursing mothers should have from three-quarters to one quart of milk a day, according to these authorities, and other adults should have from three-quarters of a pint to a pint of milk a day. These authorities point out that too little calcium in the diet retards bone growth, causes rickets, may result in bone deformities, produces poor quality of teeth and lowers vigor and vitality. Whole milk also is rich in phosphorus.

Unfortunately there are many people who do not like the taste of milk. For all such people, a delicious milk drink should be made.

One mother makes her children eager for milk by giving it to them in milk shakes. "They call one drink a chocolate froth," she says. "I take a level teaspoon of cocoa and 1½ teaspoons of sugar, mix in the bottom of a glass with a few drops of milk until it's smooth, add a drop or two of vanilla flavoring, fill the glass with milk and shake it with an ordinary tin shaker. The youngsters are crazy about it." She goes on to say, "They like it sometimes without the chocolate, just the vanilla and sugar."

Sugar is Nature's ideal flavor. "Help make children drink milk," says an eminent food scientist, "by adding chocolate and sugar." The Sugar Institute.
