acquaintance is an advocate of close supervision in both work and play, so she sharply criticised the methods of a certain new-style private school. While visiting there she found one child fussing by herself with various boxes and other objects on a small table.

"What are you doing?" she asked. The child tossed her curls and replied in a fretful tone, "I don't know what I'm doing."

The visitor regarded this as strong evidence against the school and against every other planned along the lines of incidental education. To me, the happening by itself was not conclusive. Surely it isn't well to get children in the way of aimless work, play or idling, yet why shouldn't they fuss away sometimes, even irritably and resentfully, without knowing what will come of their efforts? All worthy creative workers have gone through hour after hour of such experiences.

Often, even as children, these future artisans and artists had a definite goal in mind but would have hesitated to disclose it for fear of ridicule. At other times their manipulations were purely experimental; the sum total of profit to be shown—and perhaps shown only years afterward—was mastery of the tools of thought and hand. All children need to spend much time just getting acquainted with things.

Rightly circumstanced boys and girls will do enough of this outside; but how few in this age are rightly circumstanced for normal childish development! Literally millions have no suitable home play space and playthings; many (rich, poor and middle class) have their hours too crowded with other things to allow for developing individually outside of school. They must have their chance there or nowhere.

Directed play and study have their place, but are they not given too large a place in the lives of most twentieth century children? That means too little margin for the experimenting, the observation and first hand thought, the self-exploration and independent actions which are basic elements of all true education.

Directed play and study have their place, but are they not given too large a place in the lives of most twentieth century children? That means too little margin for the experimenting, the observation and first hand thought, the self-exploration and independent actions which are basic elements of all true education.

"Do something; don't idle!" was the frequent injunction of the mother of a famous son. This was good counsel, yet how often a child might fail to know that he or she was truly "doing something," when engrossed in a very worth while way!

We have a homely word to describe such employment of one's time. It is "fussing." "I've been fussing over that for a long while," says the successful inventor, the author, the scientific investigator, the statesman, to explain results over which we exclaim with pleasure and respect.

What valuable creative work, or executive work of the higher types, is ever performed by individuals who never spent long hours concerning which they must honestly say that they didn't know then what they were doing? Failure is often the road to success, and the habit of patient fussing is a profitable one for every child to form.

or killed by a bull. The truth is, most bulls are kept confined in filthy imprisonment, often deprived of air and sunlight, or standing in mud and filth up to their knees, and neglected as to food and water, and they look on mankind as an enemy. For lack of freedom with the herd they become more or less insane and dangerous. When bulls are cared for and entered for prizes in fairs and live stock shows they are treated with great kindness and respond to good treatment.—Exchange.
