We do not ask you to contract your calves to us, but we do ask you not to contract your calves to anybody else, because we are at this time and will be next season, able to pay you more than anybody else will pay you for your young calves. We come to your place to get them and pay you the cash. Call us up. Both phones. Bell phone No. 8222. Nelson & Melchior.

The Misses May and Ethel Gemmill of Grand Forks, N. Dak., are visiting at the home of their uncle T. E. Eppelett. The visitors accompanied by the Eppelett girls made the trip over the lighthouse trail to Bayocan with Judge Henderson and L. V. Eberhard, last Sunday. This walk of some 14 miles was unusual for them. They returned the same day rather tired, after their long hike.

Go to the "Ramsey Good Eats" for the best of everything in good things to eat. Oley will treat you right.

Subscribe for the Herald, it comes twice a week.

MARRIED

At the residence of Mr. and Mrs. G. L. Dick in Sonnymeade at eight o'clock on Wednesday evening Mr. Lewis E. Dick and Miss Madeline E. Brace were united in marriage by the Rev. Edward Gittins, in the presence of the members of the family, and intimate friends. These young people who are well and favorably known in the community, were congratulated on this happy occasion by a goodly number of their young friends, who came to wish them many happy years of wedded life, to which Mr. and Mrs. Dick responded with a treat of delicious ice cream and cake, which all enjoyed. Miss Elsie Dick had the honor of making the wedding cake which was of excellent quality. The young people went away on a brief wedding trip. They will make their home in Tillamook.

SPOTS ON THE SUN

The Way They Affect Our Source of Light and Heat.

POINT TO THE GRAND CLIMAX

When Darkness and Cold Shall Overtake Our Planet and Smother It in the Chill of Death—Their Effect Upon Climatic and Weather Conditions.

The return of sun spots is a phenomenon that astronomers always regard with great concern. They come docking back once in about every eleven years. It takes on the average four and a half years for them to reach a maximum of numbers, when the sun is seen to be more or less speckled every day, and six and a half years to decline again to a minimum, when for months in succession the sun's face is as clean as a polished mirror. Upon the whole the heat on the earth, taking its entire surface into account and basing the observation on the temperature of the atmosphere, is about 1 1/2 degrees of the Fahrenheit scale lower at sun spot maximum than at sun spot minimum.

This cannot be wholly due to the darkening of the sun caused by the presence of the spots, since, as Mr. C. G. Abbott of the Smithsonian Institution has shown, the amount by which the temperature is lowered is five times too great to be accounted for in that way.

But there are other ways in which an intensification of a host of spots on the sun makes its effects felt upon our globe. The most conspicuous of these is in connection with the earth's magnetism.

The earth is a great magnet, and the sun appears to exercise a direct influence upon its magnetic state, that influence varying with the condition of the sun as to spotlessness. When sun spots are at a maximum, magnetic storms of great violence occur, during which the electro magnetic excitement of the earth is vividly manifested—in the atmosphere by imposing displays of the aurora borealis, and in the earth itself by vagabond currents which interrupt telegraph and cable communication, and sometimes leap into visibility in the form of crackling sparks and electric flames playing about the instruments.

Occasionally it has been possible to trace phenomena of this kind to the influence of individual sun spots of unusual magnitude and activity. It is like the transmission of a shock from the sun to the earth, across a gap of 86,000,000 miles, supposed to be filled with nothing but the invisible and intangible ether.

Exactly how the forces that produce spots upon the sun affect the earth's weather is an unsettled question. There is a considerable amount of evidence for saying that such storms as our western tornadoes, the hurricanes of the West Indies and the typhoons of the China seas are far more numerous during sun spot maxima, and especially during the time that the spots are increasing in numbers. It has also been thought that wet and dry seasons are connected in some way with the sun spot cycle, but on this subject the evidence is contradictory. Some statistics show that dry seasons accompany sun spots and others that wet seasons accompany them.

But all of these things are really of little account in comparison with the great question of the effects produced upon the sun itself. The earth is a speck in the infinite vault of space, and we are animated atoms living for the fraction of a moment upon that insignificant speck. Of how great consequence in the vast scheme of the creation can the little questions that relate to our ephemeral comforts be? If a sun flame should lick us up our disappearance from the universe, physically considered, would be of less importance than that of the minutest drop of water from the ocean. But if the sun should disappear there would be a star gone from heaven. A part of the universe at least would notice its absence. Whatever threatens the existence of the sun, then, has an appreciable importance. The astronomer finds that the sun spots are symptomatic of progressive changes which will eventually bring the sun's career to an end, and so he studies them not for the sake of finding out merely how they may affect our petty affairs, but in order to trace for his intellectual satisfaction the grand phenomena of the life and death of a star. And in doing that he is pursuing the only course which can rescue man from oblivion, offsetting his material insignificance and nothingness with the relative greatness of his mind.—Garrett P. Services in Spokane Spokesman-Review.

The Blue Heron.

Notwithstanding the nature fakers who write wonderfully unsound natural history, the heron does not spear prey with its bill (nor does the loon: it bites them, nips them between the long, sharp mandibles. We have had captive herons and have seen thousands of wild ones all over this continent, and they do not do the silly trash told of them by the nature fakers.

Some of the nests are as big as a small haystack, built upon year after year until they reach enormous weights, very often up to 500 pounds.—Outing.

Good humor and generosity carry the day with the popular heart all the world over.—Alexander Smith.
