

Survey Shows Timber Growth

More than 10,000,000 acres of once-logged timber lands in the Douglas fir region of Oregon and Washington is growing timber at an average rate of from 300 to 1,000 board feet per acre annually, it was disclosed in a survey just completed by the joint committee on forest conservation.

Total Douglas fir timber area in the two states, according to the report of the committee, which represents the West Coast Lumber-

-DOUGLAS FIR TIMBER WILL SUPPLY JOBS FOREVER-

men's and Pacific Northwest Loggers association, is 25,790,000 acres.

Of this total, 42.6 per cent, or 10,987,000 acres, is mature and over-mature timber which has largely ceased to grow, and 17 per cent, or 4,383,000 acres, is poorly stocked or has been cut over since 1920.

The remaining 10,420,000 acres, from which at least one crop has already been harvested, is the real producing area, and is divided as follows: 12.5 per cent in growing trees more than 16 inches in diameter; 17 per cent in growing stands from 6 to 16 inches in diameter; and 10.9 per cent in trees under 6 inches.

"The survey shows clearly that the timber wealth of the region is steadily increasing," said Colonel Warren G. Tilton, forest engineer

for the committee.

"Good forest management has played an important part in this increase, and as additional mature timber is cut, new growth will be permitted to start.

"In the past 15 years, the recorded timber growth in Washington and Oregon has increased approximately 50 per cent. In 1933 the growth of trees over 16 inches in diameter was 2.5 billion feet a year. In 1945 a resurvey showed that the growth had jumped to 3.7 billion feet.

"In addition, several billion feet of growth are being added annually to trees less than 16 inches in diameter—a growth volume which present inventorying standards do not include.

"The survey shows the encour-

aging results of better fir protection and cutting practices, both of which are being constantly improved."

Approximately 36,000 people are engaged in operating New York's City subways which carry 5,410,000 passengers on an average workday.

Nearly 4,000 pounds of cultivated mushrooms are being produced monthly in the caverns of abandoned lime diggings near Great Barrington, Mass.

Electric Fence Rules Listed

The increasing use of electric fences and electric fence controllers has prompted the National Bureau of Standards to list safety rules for their operation.

Easily and cheaply operated, fences and controllers have proven satisfactory for temporary and permanent fencing. While either plain or barbed wire may be used, the latter type is preferred because the barbs penetrate the thick coat of animals which sometimes insulates them against shock. The wire may be attached to porcelain insulators and mounted on posts or stakes as far as 50 feet apart.

set up by the National Bureau of Standards:

No fence shall be energized from any electric source except through an approved controller. Any electric fence or portion thereof installed along a public proved markings or signs clamped to the fence wire or fastened to posts at intervals not greater than 200 feet.

An approved marker shall be as board, or other durable waterproof material not less than 4x8 inches, painted on both sides with a pure chrome yellow background the following text: "ELECTRIC FENCE." The lettering of the text shall be in black letters not less than an inch high. Other lettering, with letters not more than five-eighths inch high, may be placed on the reverse of the side with the required lettering.
