## Couples Attend Portland Rites

NATAL - PITTSBURG — Mr. and Mrs. DeeVeere Hershey, accompanied by Mr. and Mrs. Mike Mullins of Forest Grove, attended the wedding of Carol Chandler and Jon Carter in Portland February 19. Afterwards they visited at the home of Mr. and Mrs. Jack Childs.

Mr. and Mrs. Charles E. Cook and son Eddie of Walla Walla spent the week end here recently with his folks, Mr. and Mrs. R. J. Ekhoff. Mr. and Mrs. Larry Overberg of Portland were also recent callers at the Ekhoff home.

Sunday dinner guests of Mr. and Mrs. DeeVeere Hershey were Mrs. Albert Childs, Jim Mullins, Mr. and Mrs. Mike Mullins and daughter Tara and Billy DuPuis. Billy spent Sunday night with Dee Hershey.

Mr. and Mrs. Barr of Mist called on Mr. and Mrs. Noble Dunlap recently.

Mr. and Mrs. Reed Holding of Scappoose visited Mr. and Mrs. Max Oblack Thursday.

Mr. and Mrs. John McLeod and three sons of Yamhill spent Sunday visiting with her folks, Mr. and Mrs. Orin Davis. The group drove to Timber Junction for lunch. After they returned to the Davis home, Mr. and Mrs. Bob Davis and son of Portland called on them.

## Applications Due At Clatsop

Applications for admission to the fall term of Clatsop college, Astoria, are now being accepted, according to Dr. Stewart F. McCollom, director of admissions.

To apply for admission, a student should submit immediately, a completed Clatsop College application form. Upon high school graduation, a grade transcript must be sent to the college in addition to a health form.

No admission tests are required although English and mathematics placement tests are required for some students. It is recommended that college entrance examination board scores be submitted, if they are available.

The application deadline for fall term scholarships is March 15.

Strokes are the third leading cause of death in the United States, taking 200,000 lives each year.

## IN MEMORIAM

IN LOVING memory of our mother, Mrs. Mary Peterson, who passed away thirteen years ago March 5. "Gone but not forgotten."

Daughters:  
Alice Lindsay and  
Nellie Dunlap 9t1

## AROUND THE FARM

By  
Don Coin Walrod

Two years ago when working on sod-webworm controls in bentgrass fields at Clatskanie, we reported in this column that researchers had found that natural diseases were killing many of the pests. At that time some thought was given to the possibility of control procedures using cultures of the disease organisms.

Now researchers are using mass-produced insect viruses in tests to control cabbage looper and corn earworm. These viruses occur naturally, but natural epidemics generally occur too late in the season to prevent crop damage. Tests indicate that early-season spray applications of the virus will induce artificial epidemics and control the insects before they damage crops.

Studies are now under way to determine favorable times, rates and frequency of application, and to gather further data on effectiveness and economic advantages. In addition to providing a tool for control of insects, this method of control has the advantage of eliminating residue problems. It is important to recognize that biological control methods seldom provide more than partial control. Just as with insecticides, insect species have built-in facilities to cope with factors that tend to destroy them as a species.

The Brown Swiss Cattle Breeders' association will provide any boy or girl 10 to 21 years of age who has title to at least one registered Brown Swiss female recorded in his or her individual name an opportunity to become a junior member. There is no charge for junior membership and such membership permits the junior to register his animals at member rates until his or her 21st birthday. A junior membership does not, however, entitle the individual to further privileges such as voting, etc.

Application blanks, available upon request, may be received by writing Marvin L. Kruse, secretary, Brown Swiss Cattle Breeders' Association, Box 1019, Beloit, Wisconsin. Upon receipt of the application and after ownership of a registered female is substantiated by records in the association office, a junior membership certificate will be sent to the individual.

The trend is for the use of more wettable chemicals for the control of weeds, insects, and diseases. Wettable powders are less expensive to market but more difficult to apply than soluble pesticides. Wettable powder sprays require special nozzles to withstand wear, vigorous agitation to keep them in suspension, larger screens to prevent clogging, and application volume of 15 to 20 gallons per acre, or less.

Before the spray season arrives is a good time to make changes or improvements in your spray rig so that it will handle wettable powders with the least trouble and least danger of damage due to over application or under application. Here are some of the things that should be done:

1. Use mechanical agitation if at all possible;
2. Use a 50-mesh screen, or slightly larger, but not one large enough to permit particles to pass that will clog orifices;
3. Operate at the lowest pressure that will give uniform and adequate coverage. This may require new nozzles or new orifices.

Orifices made of special hardened alloys, or hardened stainless steel, give excellent wear against erosion. There are several other types of nozzles that are coming into more general usage, including the flooding nozzle and the whirl chamber nozzle. Both give good spray patterns at low pressures and have an excellent service life in brass. They can also be obtained in stainless steel.

A fact sheet entitled "Equipment Recommendation for Spraying Wettable Powders," is available from county extension offices.

Principal users of such spray materials in Columbia county have been strawberry growers, but Everett Skeans, Rainier, has found the program useful in forest seedlings, and Wallace Johnson, Scappoose, has successfully used alazine in controlling weeds and grass in corn.

Bulgur, a specially prepared pre-cooked wheat product, has been finding favor in many foreign countries, particularly those where rice has been one of the principal staples in the diet. Market possibilities will likely improve as a result of a new low-cost process developed by the Agricultural Research Service to remove dark bran from wheat, or

other cereals, leaving a clean, creamy-white whole grain.

The new process will result in a bulgur that is nearly white. This light-colored wheat product has a good commercial potential, not only in domestic markets, but also overseas, especially in countries where regular bulgur is not yet well accepted because of its color and bran content.

Even without the new debranning process, U. S. export of bulgur has risen seven fold — from 60 million pounds in fiscal 1962, the first year it was exported, to 420 million pounds in fiscal 1964.

Since the new process removes only the bran, it is more efficient than pearling, the commonly used abrasive process which removes outer coats of the grain, including a portion of the endosperm. Food value of the new product in thus higher.

Oats and barley can be peeled by the same new process, but these peeled grains will not be nearly so white as those of wheat. The peeled grains can be milled to flour or used in other ways.

Dr. Albert L. Ingram Jr. of Pennsylvania State University reports that eating morning glory seeds can result in hallucination and possible addiction, and that at least one suicide has resulted from this cause. Apparently there have been instances of people eating these seeds purposely because of the narcotic effect.

Through the Journal of American Medical Assoc., Dr. Ingram has urged controls be established over the sale of these seeds. So far as we know, no action has been taken to put these seeds under some type of regulatory provision, but the potential danger of the seeds of this old-time garden flower may result in some action by federal agencies.

Producers of wheat, corn or barley will want to acquaint themselves with the provision of the 1965 feed grain program. This voluntary program is essentially the same as the 1964 program with the deadline on sign-up being March 26.

Farmers who sign up and meet provisions of the feed grain program may qualify for diversion payments, price-support loans, and price-support payments on the normal yield of the diverted acres. The wheat program offers participating farmers diversion payments, price-support loans, and domestic and export certificates with a cash value for as much as 80 percent of the normal production of the allotment, provided it is planted. Some substitution between feed grains and wheat can be made.

Because wettable powders for use in weed and insect control are increasing, apparently due to the fact that they are less expensive to produce and market than other forms, spray operators need to give some special attention to their equipment.

Wettable powders are more abrasive than other materials. Consequently, if an operator is using brass nozzles he may find that wear at the orifice has increased rate of application considerably. This in turn, may increase the cost of application, affect residues, or cause crop damage.

While growers can make frequent replacement of brass nozzles, a better alternative is to use one of the abrasion resistant nozzles on the market. In order of increasing cost these might be stainless steel, hard-

## Vernonia Eagle

6 THURSDAY, MARCH 4, 1965

ened stainless steel, or special hardened alloys.

Spray pressures are important in this business of nozzle wear. Using brass nozzles, the wear life at 30 pounds per square inch may be four times the same nozzle at 75 PSI. High pressures are not needed for many of the chemicals now in use.

Urea is a nitrogen compound produced from carbon dioxide and ammonia. It is used in agriculture as a fertilizer and as a source of protein for cattle and sheep. Urea in industry goes into the manufacture of plastics.

Sales of urea are now well over a million tons annually, having tripled in the last six or seven years.

About 80 percent of the urea produced in the U. S. is sold for fertilizer, 13 percent for feed and 7 percent for industrial uses.

Sales of urea for feed have gained sharply since this outlet reached a commercial scale in the early 1950s. The 142,000 tons sold in 1963 is equivalent of about 760,000 tons of 44 percent protein soybean meal.

Urea is fed only to ruminants, since only the bacteria in the rumen can convert the nitrogen to usable protein. Urea alone contains no energy so molasses or grain is usually fed with it. Most nutritionists recommend that no more than a third of the total protein in a complete ration be replaced by urea. As an example, in substituting urea for an oilmeal, 7 pounds of the meal are replaced by 1 pound of urea plus 6 pounds of corn.

Despite a number of limitations in feeding urea, the chief advantage is in preparing less costly rations in periods when prices of natural protein are high in relation to the prices for cattle, sheep and dairy products.

Timber owners face the possibility of further losses of standing timber this year—now from the Douglas fir bark beetle. There is considerable evidence that some of our green standing timber has been attacked by heavy beetle populations. If the trees are not successful in "pitching out" these beetles when sap flow starts this spring, trees will be girdled, needles will brown from the top down, and trees will die.
