USE LIQUID FERTILIZER

FOR BIGGER AND BETTER CROPS

Easy To Apply - Quick Results

NO DRILLING, BROADCASTING or SPREADING

Liquid fertilizer is a highly concentrated plant food, composed almost entirely of soluble plant nutrients. It is immediately available to the root system, and only a minimum of time is required for crops to respond after it has been applied, and can be used all through the growing period.

There are many advantages in using liquid fertilizer. Frequent feeding of crops result in more continuous, uniform growth, than one or two large applications of plant food during the season. The number of applications varies, however, with the climate, time of year and variety of crop being grown.

Unlike other kinds of commercial fertilizer, liquid requires very little labor for its use. It is applied with the water.

Of great significance is the fact that with the use of LIQUID FERTILIZER, plant nutrients may be applied when they are needed by the plants and by application directly into irrigation water. This may be done at any time during the plant's growth without the slightest danger of burning and injuring tender feeder roots or injuring plant leaves or foliage with heavy side dressing equipment.
