Standard develops peacetime use for atomic energy

How could these products be kept separated... products ranging from diesel fuel to high-octane gasoline... as they follow each other through this common carrier line? This problem has been solved efficiently by using atomic energy.

Each time a change to a new product is made, very minute amounts of radioactive tracer material are put into the line... tracer material prepared especially for this use in the Government atomic pile at Oak Ridge, Tennessee.

Using a Geiger Counter, operators at the destination can tell exactly when the radioactive tracer arrives in the pipe... and they can switch the new stream of gasoline or oil into the proper tank. The radioactive tracer is so diluted in each batch of products that only the recording made by a Geiger Counter can tell you it's there. Its radioactivity will be far less than that of a luminous watch dial.

This is one of the first commercial uses of atomic energy in American industry. But it won't be the last.

Our scientists... and those of other companies... are fast learning how to make this great development work for peaceful purposes. You'll see the results of this knowledge soon... not only in improved methods of transportation but in new and useful products.
