MR. ALFALFA SEED GROWER:

In Alfalfa Seed Crops

DODDER IS CONTROLLED WITH JACK WILSON Pelletized CHLORO IPC-10**A. Where first cutting is taken for hay . . .**

1. As soon as the first cutting of hay is removed, go over the field with a burner. This is to kill any Dodder which may be established on the alfalfa stems below the level of the mower sicklebar.
2. Evenly apply JACK WILSON PELLETIZED CHLORO IPC-10 at the rate of 60 pounds per acre.
3. Promptly irrigate the field to activate the pellets. Dodder is a shallow germinator — irrigate lightly. Later, irrigate as usual.

B. Where no clipping is done ahead of seed crop . . .

1. Make close and frequent inspections of field to determine when Dodder starts to germinate. Keep a record by date of inspections. Inspect closely and often.

2. Time the application of pellets to coincide with the first germination of Dodder, or as soon thereafter as possible.

3. Evenly apply Jack Wilson Pelletized Chloro IPC-10 at the rate of 65 to 70 pounds per acre. This greater dosage is required to last longer and to assure more even soil coverage against intervening foliage, where no burning has been done.

4. Promptly irrigate the field to activate the pellets. Dodder is a shallow germinator so irrigate lightly. Later, irrigate as usual.**IMPORTANT:**

Where the first cutting is taken off and the field burned and treated as under "A"—JACK WILSON PELLETIZED CHLORO IPC-10 will give best control of Dodder.
