Most Lung Ailments Aided by Treatment

A generation ago, most lung ailments were severely crippling or fatal; but now, thanks to medical progress, virtually all respond to treatment.

The January Reader's Digest, in an article by J. D. Ratcliff, contrasts the mortality rates from lung ailments 20 years ago with the situation today: tuberculosis, once described as "captain of the men of death," has been demoted to the rear ranks. Pneumonia death rates are one sixth as high as they were a few years ago. Lung cancer still is a grim reaper, but it is no longer 100 percent fatal.

Better diagnosis and treatment are responsible for these gains. Today's specialist can slip a slender bronchoscope down the windpipe and into the larger bronchial passages within the lungs to see conditions, and snip samples of suspicious tissue for microscopic examination. Through a battery of tests he can measure the mechanical efficiency of breathing, even determine gaseous diffusion through the walls of the microscopic air sacs within the lungs.

An assortment of new drugs relieve the muscular spasm and inflammation of asthma. Antibiotics have checked the attack of pneumonia bacteria. Daring new surgical techniques make it possible to keep the patient supplied with life-giving air even during deep lung surgery, making it possible to excise cancerous areas or even collapse a diseased lung.

The lungs, Ratcliff writes, deflate half a billion times during the average lifetime. Wherever we live, from the icy north to the desert to the smoky city, they require the hot, moist, clean air found in a tropical swamp. Minute hairs in our breathing passages trap the dirt, mucous membranes produce the needed moisture. Tears — which also run through the nasal ducts — produce lysozyme, one of the most powerful bacteria-destroyers known. Without these safeguards, we would die of flaming infections.

The article, "Those Wonderful Windbags—Our Lungs," is condensed from Liberty of Canada.
