

Trick or Treat to Help Kidney Patients

The Kidney Association of Oregon has announced the opening of its 1977 statewide sale of Halloween "Trick or Treat" candy to help finance the cost of providing artificial kidney machines, training and medical supplies for Oregonians suffering from kidney failure.

At the same time, KAO issued an appeal to individuals, civic groups, schools, veterans, fraternal, busi-

nesses, churches, youth and men and women's clubs to come to its aid by helping to sell the Halloween candy during the annual fund-raising event.

Chuck Foster, KAO executive director, said, "a number of organizations and community groups around the state have already placed orders for the candy, but in order to raise as much money

as possible for our patients, we need the help of other groups." He added, "We hope that through this Halloween candy sale we can obtain the money to provide several artificial kidney machines."

The Halloween packages contain 20 Sherbits candy 5-flavor rolls, which are attractively boxed and cellophane wrapped. There are 30

boxes in each case. A Kidney Association label on the box identifies the product. Each box of candy sells for \$2.00. If possible, people are asked to order in units of complete cases in order to facilitate handling.

"Most families," said Foster, "will buy a supply of Halloween candy for 'Trick or Treat' goblins anyway. We would appreciate people buying their candy for KAO and thereby helping to save lives."

Individuals and organizations who want to help KAO are asked to send orders for candy to the Kidney Association of Oregon, 7008 N. Interstate, Portland, Oregon 97217, or call KAO at 283-4444.

Cost includes air fare, health insurance, supervision and administration. Host families meet students at the airport and contribute room, board and lots of love. American and Canadian youth can join the program to Central America and Mexico for about eight weeks in summer.

Participation in Intercambio is a unique experience in life, enriching for the host family and most beneficial to the young person who, by sharing family activities in a foreign culture, develops personal qualities so vital to his future as a potential leader and responsible member of our world community.

For further information, please contact Evelyn Coleman, 495 Superior Street, South, Salem, Oregon, 97302, phone 364-7707.

GRANGE NEWS

Oregon Trail Grange

Oregon Trail Grange members met in regular session Thursday evening, September 15, with Master Harold Kurtz presiding.

Don Somers reported for the Agriculture Chairman and called attention to articles in the Gate City Journal about the sale of wheat and corn to the Soviet Union and to the Peoples Republic of China as the world's largest wheat buyers.

Grange Master Kurtz led a discussion about the law concerning the 160-acre per person limit on land served by government water supply.

Frank Sherwood and Loyd Adams gave some interesting 1928 history of the Owyhee Ditch Company. Sherwood served as a member of the Board of Directors for the Ditch Company for over 30 years.

YOUR GARDEN

A harvest of wormy apples and pears awaits home gardeners who fail to spray their fruit trees repeatedly to control the codling moth.

The adult moth has a wingspread of about 1/2 inch. Its front wings are brownish gray with a bronze band at the tip, according to Duane Hatch, Oregon State University Extension home gardening coordinator.

Except on the Oregon coast, where the weather is too cool, the codling moth is now laying eggs on the leaves and young fruit of apple and pear trees. When the eggs hatch, the white to pink larvae enter the fruit.

A spray of diazinon or sevin, used according to label directions, should be repeated every two to three weeks to destroy the moth and the larvae. Observe the recommended interval on the label for the last spraying before harvest, Hatch advises.

There is no need to worry about the early blossoms that emerge on cucumbers, and squash and then fall off before setting any fruit.

"Cucumbers and squash often have an abundance of male flowers that bloom and die before the female blossoms appear," says Duane Hatch, Oregon State University Extension home gardening coordinator.

Female blossoms with small cucumbers or squash at their bases will appear later and fruit production will proceed normally.

Sometimes female blossoms on squash will bloom before the male flowers. The early female flowers will dry up, or produce small fruits that die and then rot.

This is a natural, self-pruning process. It will allow for better fruit development later Hatch notes.

If the female blossoms fade away at the height of the growing season, however, it is likely that bee activity is not sufficient to pollenate them.

"Inadequate pollination is often a problem in the central areas of large cities," says Hatch.

Apartment dwellers growing container gardens are advised to do what they can to encourage bee activity. This includes careful use of insecticides, especially sevin, which is highly toxic to bees.

Activities In Arcadia

Capitol Guides report a total of 43,143 visitors during the first six months of the year--a figure nearly equaling the record 43,463 visitors during the same period in 1971. That session often is described as the one during which the people discovered the Legislature.

The telephone callers taking advantage of the Legislative Information Service exceeded 50,000 -- jamming lines with as many as 592 calls on the busiest day and exceeding 500 calls for days on end as the session neared adjournment.

The weight of such scrutiny can't help but attract attention among politicians whose tenure depends upon the electorate's will every two or four years.

So although the 1977 Legislature succeeded in shrugging off early complaints about expanded space in the Capitol wings, colorful furnishings and modernistic art objects--other criticism likely will provoke introspective study in the months ahead.

Some members already sense a mood among the people about government that seems to reflect a growing attitude that more isn't necessarily better.

Host Families Needed

Host families are needed for young people from Mexico (11 to 16 years of age) who are participating in the exchange program, "Intercambio" or International Student Exchange Program. The students live with an American family practicing English and learning our way of life and culture. The El Salvadorians arrive November 17 and return home January 20. From Nicaragua and Costa Rica the students arrive December 1 and return home February 10.

Intercambio, an international cultural exchange program, aims to provide young people an opportunity to understand one another's cultures. Founded in Mexico (1959) by Rt. Rev. Placid Reitmeyer, an American Benedictine priest, it is legally constituted with a lay board of directors. Central office personnel in Mexico City are assisted by volunteer couples in Central America, Mexico, Canada and the United States who coordinate the work locally, interview families and select students according to age, sex and comparable interests of host brothers and sisters.

Students are sponsored by their own families or civic groups in their own countries.

Pollutants Below Federal Requirements

Estimated maximum ground-level concentrations of pollutants from a coal-fired power plant in southern Idaho would be well below federal and state air-quality restrictions, ranging from 13% to less than 0.1% of the toughest limits set to protect human health and crops.

So says a preliminary report prepared for Idaho Power Company by the environmental sciences division of Stearns-Roger, Inc., Denver, and now on file with the Idaho Public Utilities Commission.

The report, assuming a 500-megawatt, scrubber-equipped plant with a 600-foot stack and fired by low-sulfur Wyoming coal, makes these conclusions about the plant's emissions of the best-known pollutants:

Sulfur-dioxide (SO2)--The estimated maximum 24-hour concentration would be 13.3 micrograms per cubic meter, or only 13% of the toughest standard of 100 micrograms.

Nitrogen oxides (NOX)--The estimated annual concentration would be 0.8 micrograms per cubic meter, or only 0.3% of the toughest standard of 100 micrograms.

Particulates--The estimated maximum 24-hour concentration would be 1.4 micrograms per cubic meter, or only 5% of the toughest standard of 30 micrograms.

Fluorides--The estimated maximum monthly concentration would be 0.006 micrograms per cubic meter, or only 0.1% of the Idaho standard of 5.8 micrograms.

The report said the plant's emissions of hydrocarbons, carbon monoxide and photochemical oxidants, whose primary measurable constituent is ozone, would be "negligible."

Lower temperatures resulting from a scrubber would condense such trace elements as mercury, arsenic, lead and cadmium, with their particles or droplets also being collected in the precipitator.

Dr. Louis York, Stearns-Roger chief environmental scientist, said in commenting on the report that ground-level concentrations are the "only relevant data" that should be used in evaluating the risk to humans, animals and vegetation from coal-fired plant emissions.

"It's at ground level that people breathe and animals and vegetation are located--not in the upper atmosphere where gases from a plant's tall stack are diffused and dispersed as they mix into millions of tons of air."

The 63-page report is based on data from the National Weather Service and U.S. Air Force weather stations and from sophisticated instruments on meteorological towers at each of the three sites--American Falls, Bliss and Sid's Crossing--Idaho Power has suggested for possible location of a coal-fired plant.

Stearns-Roger computed the ground-level concentration estimates from the data with dispersion modeling methods developed by the Federal Environmental Protection Agency.

York, who recently discussed the proposed plant's environmental impact at public meetings in Gooding, Shoshone and American Falls, described the report as "part of a package" of information intended to help the PUC determine a plant site.

He said Stearns-Roger is preparing several other reports, including one on water chemistry and another on vegetation and animals in the three potential site areas.

CWA chairman Lois Boenig reminded Grange women that the first Club meeting of the year will be held Tuesday, October 4, at 2 p.m. at the home of Thelma Parr with Orma Cleaver as co-hostess. All Grange women are urged to attend.

Refreshments were served by Marguerite King and Marguerite Moss. The next regular Grange meeting will be held Thursday evening October 6, 8:30 p.m.

Eastern Star

Star dusters met September 12 at Beatrice Grossnickle's home.

After a short business meeting the group adjourned to crack walnuts to put in carrot pudding to be sold at the Mini Bazaar in December.

Delicious refreshments were served by our hostess and her co-hostess Vera Webb. The next meeting will be October 10 at the home of Gloria Smith.

Thank You Mr. Buyer

For Making The Junior Livestock Sale A Success

Malheur County 4-H Clubs and FFA Chapter take this opportunity to express their appreciation to merchants and individuals who made their Junior Fat Stock Sale such a success. Our special thanks to the Don Hancock Livestock Company which underwrote the sale, managed the sale, handled the billing, collection and accounting. Idaho Meat set the support price for the beef, Swede Erstrom for the lambs, and Davis Pack set the price for the hogs. Also a special thanks to those who bid or set bids. Trucking without charge was furnished by Cliff Hoppeter and other individuals. Donations were made to the Shrine Hospital by Russell Land and Livestock and KSRV Radio.
